## STATUS OF WOMEN

IN THE STATES

THE STATUS OF WOMEN IN THE STATES: 2015 Employment and Earnings

## About This Report

This report is a part of the Institute for Women's Policy Research's series, The Status of Women in the States: 2015, which uses data from U.S. government and other sources to analyze women's status in each state and the United States overall, to rank and grade states on a set of indicators for six topical areas, and to provide additional data on women's social, economic, health, and political status in states across the nation. The Institute for Women's Policy Research has published reports on the status of women in states and localities throughout the United States since 1996 covering all 50 states and the District of Columbia. The reports have been used to highlight women's progress and the obstacles they continue to face and to encourage policy and programmatic changes that can improve women's opportunities. Created in partnership with expert advisors, the reports have helped state and local partners educate the public on issues related to women's well-being, inform policies and programs, make the case for establishing commissions for women, establish investment priorities, and inspire community efforts to strengthen area economies by increasing the participation of women and improving women's status.

## About the Institute for Women's Policy Resea rch

The Institute for Women's Policy Research (IWPR) conducts rigorous research and disseminates its findings to address the needs of women, promote public dialogue, and strengthen families, communities, and societies. The Institute's research strives to give voice to the needs of women from diverse ethnic and racial backgrounds across the income spectrum and to ensure that their perspectives enter the public debate on ending discrimination and inequality, improving opportunity, and increasing economic security for women and families. The Institute works with policymakers, scholars, and public interest groups to design, execute, and disseminate research and to build a diverse network of individuals and organizations that conduct and use women-oriented policy research. IWPR's work is supported by foundation grants, government grants and contracts, donations from individuals, and contributions from organizations and corporations. IWPR is a $501(\mathrm{c})(3)$ tax-exempt organization that also works in affiliation with the women's studies and public policy and public administration programs at The George Washington University.

Washington, DC 20036

## Acknowledgments

This report was generously funded by the Ford Foundation; the Institute for Women's Policy Research is grateful to LaShawn Jefferson for her strong support of IWPR's work and commitment to the Status of Women in the States project. IWPR also thanks the American Federation of Teachers, Key Project Sponsor, and the Women's Funding Network, National Outreach Partner, for their support and partnership in this work, especially Lorretta Johnson, Secretary-Treasurer of the AFT and Vice Chair of IWPR's Board of Directors and Cynthia Nimmo, Interim President and CEO of the Women's Funding Network, for their enthusiastic leadership. Additional funding was provided by the Community Foundation of Southern Wisconsin, the Fairfield County Community Foundation's Fund for Women and Girls, the Foundation for Enhancing Communities, the National Air Traffic Controllers Association, the National Organization for Women, the New York Women's Foundation, OWL: the Voice of Women 40+, Sunrise Foundation, the Women's Foundation of Montana, the Women's Funding Alliance (Washington State), and the Women and Girls Foundation of Southwest Pennsylvania.

The Status of Women in the States team thanks the members of the project's advisory committee (see list below) for their valuable input. Dr. TK Logan, Professor of Behavioral Science at the University of Kentucky, and Maya Pinto, Economic Justice Program Director at the National Asian Pacific American Women's Forum, reviewed the report and provided helpful comments. In addition, many Institute for Women's Policy Research staff contributed to the production of the report. Cynthia Hess, Ph.D., served as project director and lead author and Ariane Hegewisch, M.Phil., co-authored the report. Dr. Heidi Hartmann, President, and Dr. Barbara Gault, Vice President and Executive Director, provided insightful feedback on the report and guidance throughout the project. Dr. Jeff Hayes, Study Director, and Dr. Jessica Milli, Senior Research Associate, conducted the data analysis. Senior Communications Manager Jennifer Clark and Senior Communications Associate Mallory Mpare provided editorial assistance and contributed to the development of the report design. Research assistance was provided by Research Associate Julie Anderson, Mariam K. Chamberlain Fellow Yana Mayayeva, Research Assistant Stephanie Román, and Research Intern Maya Atta-Mensah.

## Introduction

Women make up nearly half of the U.S. workforce, and their earnings are essential to the economic security of families across the nation. Yet, gender equality at work remains elusive. Women who work full-time, year-round still earn only 78 cents on the dollar compared with men, and during the last decade little improvement has been made in closing the gender wage gap (DeNavas-Walt and Proctor 2014). The glass ceiling persists, and occupational segregation-the concentration of women in some jobs and men in others-remains a stubborn feature of the U.S. labor market (Hegewisch et al. 2010). These national trends show up in states across the nation. This report examines women's earnings and the gender wage gap, women's labor force participation, and the occupations and industries in which women work. It also considers areas where women have experienced progress toward gender equity in the workforce and places where progress has slowed or stalled.

## The Employment and Eamings Composite Score

The employment and earnings composite index compares the states' performance on four key component indicators of women's status in the domain of employment and earnings: median annual earnings for women who work full-time, year-round; the gender earnings ratio among full-time, yearround workers; women's labor force participation; and the percent of employed women who work in managerial or professional occupations. Composite scores ranged from a high of 5.33 to a low of 3.43, with the higher scores reflecting a stronger performance in the area of employment and earnings (Table 2.1).

- The District of Columbia has, by far, the highest score on the composite employment and earnings index (Table 2.1). The District ranks in the top ten on all four component indicators and is first for women's earnings and the percent of employed women in managerial or professional occupations.
- West Virginia has the lowest ranking on the employment and earnings composite index. It ranks in the bottom ten on three of the four indicators and is last for the percent of women in the labor force and second to last for the gender earnings ratio.
- In general, women in the Northeast and Mid-Atlantic regions fare the best on the employment and earnings composite index. Along with the District of Columbia, seven other states from these regions-Connecticut, Maryland, Massachusetts, New Jersey, New York, Vermont, and Rhode Island-are all in the top eleven. Alaska, Minnesota, and Virginia also rank in the top eleven; Minnesota and Rhode Island tied for tenth place.
- The Southern states have poor scores on the employment and earnings composite. In addition to West Virginia, six other Southern states-Alabama, Arkansas, Kentucky, Louisiana, Mississippi, and South Carolina-are in the bottom ten. They are joined by Idaho, Montana, and South Dakota.
- The District of Columbia is the only jurisdiction to receive an $A$ on the employment and earnings composite index. No state received an A-, and two states-Maryland and Massachusetts-received a B+. Arkansas, Mississippi, Louisiana, Idaho, and West Virginia all received an F (for information on how grades were determined, see Appendix A).

## Trends in Employment and Eamings

Women's status in the area of employment and earnings has improved on two indicators since the publication of IWPR's last national report on the status of women, the 2004 Status of Women in the States, and remained unchanged or declined on two others. Women's median annual earnings for fulltime, year-round work in 2013 ( $\$ 39,157$ ) were nearly identical to their earnings for similar work in 2002 ( $\$ 39,108$ when adjusted to 2013 dollars). ${ }^{1}$ The gender earnings ratio improved during this time from 76.6 to 78.3 percent (DeNavas-Walt and Proctor 2014), narrowing the gender wage gap by 1.7 percentage points, and the share of women working in professional or managerial occupations grew from 33.2 to 39.9 percent. Women's labor force participation rate, however, declined from 59.6 in 2002 to 57.0 percent in 2014 (IWPR 2004; U.S. Bureau of Labor Statistics 2015a). ${ }^{2}$

- On the composite score for women's employment and earnings, 30 states have either gained ground or experienced no change. The jurisdictions experiencing the largest gains are New York and the District of Columbia, whose composite scores increased by 8.2 and 7.0 percent, respectively. New York's ranking improved from $19^{\text {th }}$ to $6^{\text {th }}$ place between the 2004 and 2015 releases, and the District of Columbia ranked first in both years.
- Among states that have declined, Missouri experienced the biggest loss, with a 6.5 percent decrease in its composite score. This decline is considerably higher than the state with the second largest loss, Arizona, whose score decreased by 3.0 percent. Between the 2004 and 2015 data releases, Missouri declined in the rankings from $12^{\text {th }}$ to $30^{\text {th }}$ place, and Arizona fell from $22^{\text {nd }}$ to $34^{\text {th }}$ place.

## Ea mings and the Gender Wage Gap

## Median Annual Eamings

Women's median annual earnings vary considerably across states (see Table 2.1).

- The District of Columbia ranked first in the nation for the median annual earnings of women working full-time, year-round in 2013. Women in the nation's capital had considerably higher

[^0]earnings ( $\$ 60,000$ ) than women in the second- and third-ranking jurisdictions, Maryland and Massachusetts, where women earned $\$ 49,8$ oo and $\$ 48,500$, respectively. ${ }^{3}$

- In Arkansas, Idaho, Mississippi, and South Dakota, women have median annual earnings of $\$ 30,000$, the lowest in the nation. Other states that rank in the bottom ten on this indicator include Louisiana, Montana, Nebraska, Oklahoma, South Carolina, and West Virginia.

During the last thirty years, men's real earnings in the United States have remained essentially the same, while women's have grown, albeit from a much smaller base. Between 1980 and 2013, after adjusting for inflation, real median earnings for women's full-time, year-round work grew nationally from $\$ 30,138$ to $\$ 39,157$, while men's decreased slightly from $\$ 50,096$ to $\$ 50,033$ (DeNavas-Walt and Proctor 2014). ${ }^{4}$ Among women, the growth in real median annual earnings took place in the 1980 and 1990s; since the early 2000s, women's earnings, like men's, have stagnated.

Changes to women's and men's real earnings vary across the states, however. IWPR analysis of the 1980, 1990, and 2000 Decennial Censuses (for the calendar years 1979, 1989, and 1999) indicates that between 1979 and 1999, women's real earnings increased in all but three states (48) while men's increased in only 18. Between 1999 and 2013, 27 states had positive earnings growth for women, with the strongest growth in North Dakota. During this time, men's real earnings grew in only seven states (Figure 2.1). As men's real earnings have stagnated or fallen, women's earnings have become increasingly important to family economic security. As of 2012, 29 percent of women in married couples where both spouses work had annual earnings that were higher than their husbands', an increase of 11 percentage points since 1987 (U.S. Bureau of Labor Statistics 2014a).

[^1]Figure 2.1.
Change in Real Median Annual Ea mings by Gender (Full-Time, Year-Round Workers), 1999-2013

## The Gender Eamings Ratio

The change and stagnation in women's and men's real earnings over the last several decades have contributed to the narrowing of the gender wage gap in earlier decades and more recently stalled progress in further closing this gap. Between 1980 and 2000 -when women's real earnings grew while men's remained unchanged-the gender earnings ratio increased from 60.2 percent (in 1980) to 71.6 percent (in 1990) to 73.7 percent (in 2000). Between 2001 and 2012 -when both women's and men's earnings stagnated-the gender earnings ratio remained virtually constant ( 76.3 percent in 2001 and 76.5 percent in 2012; DeNavas-Walt and Proctor 2014).

The gender earnings ratio improved between 2012 and 2013 from 76.5 to 78.3 percent (DeNavas-Walt and Proctor 2014), yet in every state in the nation, women still earn less than men (Table 2.1). The gender earnings ratio varies considerably among states, from 87.6 percent in New York, the best state, to 66.7 percent in Louisiana, the worst state.

- In addition to New York, four other jurisdictions have a gender earnings ratio of 85 percent or higher (87.4 in Maryland, 87.0 in the District of Columbia, 86.4 in Vermont, and 85.0 in Florida).
- Women in Louisiana earn just 66.7 cents on the dollar compared with men, the worst earnings ratio in the nation. In two other states-West Virginia ( 67.3 percent) and Wyoming (67.9 percent)-the gender wage gap is also greater than 30 cents per dollar.

| The GenderWage Gap: Best and Worst States |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Rank | Gender Eamings Ratio |  | Rank | Gender Eamings Ratio |
| New York | 1 | 87.6\% | Louisiana | 51 | 66.7\% |
| Maryland | 2 | 87.4\% | West Virginia | 50 | 67.3\% |
| District of Columbia | 3 | 87.0\% | Wyoming | 49 | 67.9\% |
| Vermont | 4 | 86.4\% | Utah | 48 | 70.0\% |
| Florida | 5 | 85.0\% | Nebraska | 47 | 73.1\% |

If progress continues at the current rate since 1960, the disparity between women's and men's earnings in the United States overall will not close until the year 2058 (IWPR 2014a). Among the 50 states and the District of Columbia, Florida is projected to be the first state in the nation where women's median annual earnings will reach parity with men's, but not until the year 2038. In five states, women's earnings are not expected to equal men's until the next century. At the current rate of progress, the gender wage gap is expected to close last in Wyoming-in the year 2159 (Figure 2.2).

Figure 2.2.
Projected Yearfor Closing the Gender Wage Gap by State

Note: Linear projection based on the current rate of progress in closing the gender wage gap since 1959. Projection is based on the ratio of women's to men's earnings among full-time, year-round workers aged 16 and older.
Source: IWPR calculations based on the 1960, 1970, 1980, and 2000 Decennial Censuses (for the calendar years 1959, 1969, 1979, 1989, and 1999) and the 2001-2013 American Community Survegs (Integrated Public Use Microdata Series, Version 5.0).

## The Employment and Eamings of Older Women

The majority of older people (aged 65 and above) in the United States are women, and many are active in the workforce. In 2013, nearly 14 percent of women aged 65 and older were in the labor force; among the youngest of this age group-those aged $65-74$ - more than one in five women ( 22.0 percent) were in the workforce. Slightly more than half of women aged 65 and older work part-time ( 51.4 percent).

The median annual earnings of women aged 65 and older who work full-time, year-round in the United States are $\$ 37,000$, slightly less than the earnings for all women aged 16 and older ( $\$ 38,000$ ). Women aged 75 and older who work full-time, year-round have median earnings that are $\$ 8,000$ less than those aged 65-74 (\$30,ooo compared with $\$ 38,000$ ).

- The gender earnings ratio between women and men aged 65 and older who work full-time, yearround is lower than the earnings ratio between all women and men. Older women earn 72.5 cents on the dollar compared with their male counterparts.
- Approximately 35.6 percent of employed women aged 65 and older work in managerial or professional occupations, a smaller percentage than their male counterparts (42.7 percent). Among all employed women and men aged 16 and older, the pattern differs: women are considerably more likely than men to work in professional or managerial occupations (39.9 percent compared with 33.0 percent).
- As with all employed women and men, older women and men tend to be concentrated in different jobs. Older women are substantially more likely than older men to work in service or in office and administrative support occupations; more than four in ten ( 45.9 percent) older women work in these occupations, compared with just one in five (19.6 percent) older men. Older women are much less likely than their male counterparts to work in management, business, and financial occupations ( 12.0 percent compared with 21.0 percent) and in construction or production occupations ( 5.8 percent compared with 24.9 percent). These general patterns hold true for all-age women and men as well, with slight differences (see Table 2.5 below).

IWPR calculations based on 2013 American Community Survey microdata.

## The Employment and Eamings of Millennials

The millennial generation has come of age in difficult economic times-in a period where student debt reached all-time highs and employment opportunities were in short supply. Research indicates that in 2013, the average loan debt among bachelor's degree students graduating with debt from public and private nonprofit colleges was $\$ 28,400$ (Reed and Cochrane 2014).

In the face of difficult economic times, millennial women-defined here as those aged 16-34 in 2013are pursuing many different career paths and jobs. Much like their older counterparts, however, they face a range of challenges in the workforce.

- Nearly seven in ten ( 67.8 percent) millennial women (aged 16-34) are in the workforce, compared with 73.1 percent of their male counterparts. ${ }^{5}$
- Millennial women and men have been highly vulnerable to unemployment: 11.6 percent of millennial women and 12.5 percent of millennial men were unemployed in 2013, which is well above the unemployment rates for women and men overall.
- Millennial women face a gender wage gap, albeit one that is narrower than the wage gap between all women and men. In 2013, the median annual earnings for millennial women working full-time, year-round were $\$ 30,000$, compared with $\$ 35,000$ for their male counterparts, resulting in an earnings ratio of 85.7 percent. Between 2011 and 2013, millennial women earned less than millennial men in all but one state, New York, where women of this age range earned \$38,319 compared with $\$ 37,542$ for men (Table B2.2). For both millennial women and all women, New York is the best state for the gender wage gap, and the District of Columbia has the highest earnings.
- More than one in three (34.2 percent) millennial women work in managerial or professional occupations, compared with one in four ( 25.4 percent) millennial men.
- Millennial women are slightly more likely than millennial men to work in management, business, and financial operations ( 10.2 percent of employed millennial women compared with 9.7 percent of employed millennial men). Millennial women are also considerably more likely than their male counterparts to work in professional or related occupations ( 24.0 percent compared with 15.7 percent). As with older women, millennial women are much more likely than their male counterparts to work in service occupations ( 27.2 percent compared with 20.5 percent), and much less likely to work in construction or production occupations ( 5.4 percent of employed millennial women compared with 32.9 percent of employed millennial men).

IWPR calculations based on American Community Survey microdata. Earnings data for younger women and men by state are three-year (2011-2013) averages; all other data are for 2013.

[^2]
## Eamings and the Gender Wage Gap for Women of Color

Women's earnings differ considerably by race and ethnicity. Across the largest racial and ethnic groups in the United States, Asian/Pacific Islander women have the highest median annual earnings at $\$ 46,000$, followed by white women ( $\$ 40,000$ ). Native American and Hispanic women have the lowest earnings at $\$ 31,000$ and $\$ 28,000$, respectively (Figure 2.3).

Figure 2.3.
Median Annual Eamings for Women and Men Employed Full-Time, Year-Round by Race/Ethnic ity, United States, 2013

Notes: For women and men aged 16 and older. Racial groups are non-Hispanic. Hispanics may be of any race or two or more races.
Source: IWPR analysis of American Community Survey microdata (Integrated Public Use Microdata Series, Version 5.0).

While Asian/Pacific Islander women overall have the highest earnings and Hispanic and Native American women have the lowest earnings, significant differences exist within these groups. Among Asian/Pacific Islander women, Indian women have the highest median annual earnings at $\$ 60,879$ more than twice the earnings of the lowest earning group, the Hmong ( $\$ 30,000$ ), and approximately twice the earnings of the second lowest group, the Bangladeshi (\$30,439). Among Hispanic women, women of Argentinian and Spanish descent have the highest earnings at $\$ 40,804$ and $\$ 40,586$, respectively, while women of Honduran and Guatemalan descent have the lowest earnings at $\$ 22,784$ and $\$ 23,337$. Among Native American women, median annual earnings are highest among the Chickasaw ( $\$ 42,000$ ), and lowest among the Sioux $(\$ 28,410)$ and Apache ( $\$ 28,500$; Table B2.3). These earnings differences likely stem, in part, from differences in education levels; women from the higherearning racial and ethnic groups are more likely to hold a college degree (IWPR 2015).

In all the racial and ethnic groups shown in Figure 2.3 and all but two of the detailed groups shown in Table B2.3-the Pueblo and "other" Central Americans-women earn less than men. Among the
groups in Figure 2.3, the differences are smallest for blacks and Hispanics, due to the comparatively low earnings of black and Hispanic men, which are considerably less than the earnings of men overall.

Another way of examining gender earnings differences is to compare earnings for different groups of women with the largest group in the labor force, white men. Hispanic women face the largest earnings gap, with median annual earnings that are slightly more than half those of white men ( 53.8 percent). Asian/Pacific Islander women face the smallest gap, but still earn only 88.5 percent of white men's earnings (Table 2.2).

Table 2.2.
Women's and Men's Median Annual Eamings and the Gender Eamings Ratio, Full-Time, Year-Round Workers, United States, 2013

|  |  |  | Ratio of Women's Earnings <br> to Men's of the Same Racial/ <br> Ethnic Group | Ratio of Women's <br> Earnings to White Men's <br> Earnings |
| :--- | :--- | :--- | :--- | :--- |
| Asian/Pacific Islander | $\$ 46,000$ | $\$ 59,000$ | $78.0 \%$ | $88.5 \%$ |
| White | $\$ 40,000$ | $\$ 52,000$ | $76.9 \%$ | $76.9 \%$ |
| Two or More Races | $\$ 38,000$ | $\$ 45,000$ | $84.4 \%$ | $73.1 \%$ |
| Black | $\$ 34,000$ | $\$ 37,500$ | $90.7 \%$ | $65.4 \%$ |
| Native American | $\$ 31,000$ | $\$ 37,000$ | $83.8 \%$ | $59.6 \%$ |
| Hispanic | $\$ 28,000$ | $\$ 30,900$ | $90.6 \%$ | $53.8 \%$ |
| Total |  |  | Men |  |
| American Community Survey | $\$ 38,000$ | $\$ 48,000$ | $79.2 \%$ |  |
| Current Population Survey | $\$ 39,157$ | $\$ 50,033$ | $78.3 \%$ |  |

Notes: For women and men aged 16 and older. Racial groups are non-Hispanic. Hispanics may be of any race or two or more races.
Source: IWPR analysis of American Community Survey microdata (Integrated Public Use Microdata Series, Version 5.0).

## The Eamings Ratio by Educational Attainment

Education increases women's earnings but does not eliminate the gender wage gap. In the United States, women with a bachelor's degree earn, on average, more than twice the amount that women with less than a high school diploma earn (Figure 2.4). Yet, women who work full-time, year-round earn less than men at the same educational level, and at all but one level they earn the same as or less than men with lower educational qualifications. The gap in earnings is largest for those with the highest levels of educational attainment: women with a graduate degree earn only 69.1 percent of what comparable men earn, and women with a bachelor's degree earn 71.4 percent of the amount their male counterparts earn. These data indicate that women need more educational qualifications than men do to secure jobs that pay well.

Figure 2.4.
Median Annual Earnings and the Gender Earnings Ratio for Women and Men at Different Educ ational Levels, 2013

Notes: Full-time, year-round workers aged 25 years and older. Percentages in parentheses show women's earnings as percent of men's earnings.
Source: IWPR analysis of American Community Survey microdata (Integrated Public Use Microdata Series, Version 5.0).

- Median annual earnings for women with at least a bachelor's degree are highest in the District of Columbia (\$74,ooo). Five other states-California, Connecticut, Maryland, New Jersey, and New York-have median annual earnings for women with a bachelor's degree or higher of at least $\$ 65$, ooo per year (Table B2.4).
- Median annual earnings for women with a bachelor's degree or higher are lowest in South Dakota ( $\$ 38,000$ ). Oklahoma has the second lowest earnings for women with at least a bachelor's degree at $\$ 42,000$, followed by Mississippi (\$43,0oo; Table B2.4).
- The District of Columbia has the highest gender earnings ratio for workers with at least a bachelor's degree ( 86.0 percent), followed by North Dakota ( 85.5 percent) and Rhode Island ( 84.9 percent; Table B2.4).
- The gender earnings ratio for workers with at least a bachelor's degree is lowest in New Hampshire and Texas (both at 65.0 percent). In three other states, the ratio is also below 67 percent (South Carolina at 66.2 percent, and Arizona and Virginia at 66.7 percent; Table B2.4).

## State Statutes That Address the Gender Wage Gap

- Tackling Pay Secrecy: As of 2014, ten states had enacted laws that prohibit employer retaliation against employees who inquire about other employees' wages or disclose their own: California, Colorado, Illinois, Louisiana, Maine, Michigan, Minnesota, New Hampshire, New Jersey, and Vermont (U.S. Department of Labor 2014).
- Tackling the Undervaluation of Women's Work: As of January 2015, the District of Columbia and at least five states-Iowa, Minnesota, Montana, Washington, and West Virginia-have "comparable worth" statutes or regulations for public employees to address the undervaluation of work performed mainly by women. These statutes and regulations require that compensation for work of comparable worth-measured by the skill, effort, responsibility, and working conditionsbe equitable (IWPR n.d.).
- Tackling Low Wages: As of January 1, 2015, 29 states and the District of Columbia had a minimum wage that was higher than the federal minimum wage of $\$ 7.25$. The minimum wage was highest in the District of Columbia at $\$ 9.50$ per hour; seven states had a minimum wage of at least $\$ 9.00$ per hour (U.S. Department of Labor 2015a). Several other states are scheduled to increase above \$9.50 in future years.
- Tackling the Low Tipped Minimum Wage: As of 2014, seven states required employers to pay tipped workers the full state minimum wage: Alaska, California, Minnesota, Montana, Nevada, Oregon, and Washington (U.S. Department of Labor 2015b). An additional 26 states and the District of Columbia required employers to pay tipped workers above the federal tipped minimum wage of $\$ 2.13$ an hour, ranging from a state tipped minimum wage of $\$ 2.23$ in Delaware to a state tipped minimum wage in Connecticut of $\$ 5.78$ (for the hotel and restaurant industry) and $\$ 7.46$ (for bartenders who customarily receive tips; U.S. Department of Labor 2015b).

## Cumulative Losses from the Gender Wage Gap

Losses from the gender wage gap accumulate over the course of a woman's lifetime. Average lifetime losses for all women who were born between 1955 and 1959 and worked full-time, year-round each year total $\$ 531,502$ by age 59 (Figure 2.5). Among college-educated women, the losses were even greater, due in part to the larger gender wage gap that women with this level of education face (see Figure 2.4). Women with a college education who were born between 1955 and 1959 and worked full-time, yearround each year lost, on average, nearly $\$ 800,000$ by age 59 due to the gender wage gap (Figure 2.5).

Figure 2.5.
Cumulative Losses from the Gender Wage Gap for All Women and CollegeEducated Women Bom in 1955-1959, United States

Note: Data reflect the difference between the median annual earnings of women and men who worked full-time, yearround each year.
Source: IWPR analysis of data from the Current Population Survey Annual Social and Economic Supplement (Integrated Public Use Microdata Series, Version 3.0).

## Gender Inequality in Low and High Paid J obs

Median earnings capture the midpoint in the earnings distribution: half of all workers earn above and half earn below the median. Another way of comparing earnings is to examine the gender composition of those among the highest and lowest earnings quartiles in a state. In 2013, women were less likely than men to be among the highest earners in all states in the nation (Table B2.5).

- The District of Columbia has the highest proportion of women among the top quartile of earners at 21.5 percent. New York and Nevada tie for second with 20.5 percent each, followed by Rhode Island (20.4 percent). Women are least likely to be in the highest-earning quartile in Wyoming (10.4 percent), Utah (12.5 percent), and West Virginia (13.4 percent).
- The states with the largest proportions of women in the lowest earnings quartile are Louisiana ( 34.6 percent), West Virginia ( 34.5 percent), and Utah ( 33.7 percent). Women are least likely to have earnings in the lowest quartile in the District of Columbia ( 21.7 percent), Alaska (24.0 percent), and Rhode Island ( 25.1 percent).

## The Union Advantage for Women

Union representation brings wage setting into the open and helps ensure that employers set wages based on objective criteria, such as skill, effort, and responsibility. Unions tend to raise wages for all represented workers, especially those, research shows, who are at the middle and bottom of the wage distribution, who are disproportionately women (Jones, Schmitt, and Woo 2014).

- Among full-time workers aged 16 and older, women represented by unions earn an average of $\$ 212$, or 30.9 percent, more per week than women in nonunion jobs. ${ }^{6}$ Men of the same age range who are represented by unions earn, on average, $\$ 173$ more per week (or 20.6 percent) than those without union representation (Table 2.3).
- Women who are represented by unions earn 88.7 cents on the dollar compared with their male counterparts, a considerably higher earnings ratio than the earnings ratio between all women and men in the United States.
- Among the racial and ethnic groups shown in Table 2.3, the difference in earnings between those with and without union representation is largest for Hispanics. Hispanic women represented by unions have median weekly earnings that are 42.1 percent higher than those without union representation. Hispanic men with union representation have earnings that are 40.6 percent higher than their nonunion counterparts.

Table 2.3.
Union Wage Advantage by Gender and Race/Ethnicity, United States, 2014 Median Weekly Ea minas for Full-Time Waqe and Salary Workers

|  | Union | Nonunion | Union Wage Advantage | Union Wage Advantage (in Percent) |
| :---: | :---: | :---: | :---: | :---: |
| All Women | \$899 | \$687 | \$212 | 30.9\% |
| Hispanic | \$739 | \$520 | \$219 | 42.1\% |
| Black | \$788 | \$590 | \$198 | $33.6 \%$ |
| White | \$923 | \$704 | \$219 | $31.1 \%$ |
| Asian | \$950 | \$823 | \$127 | $15.4 \%$ |
| All Men | \$1,013 | \$840 | \$173 | 20.6\% |
| Hispanic | \$838 | \$596 | \$242 | 40.6\% |
| Black | \$833 | \$648 | \$185 | 28.5\% |
| White | \$1,041 | \$867 | \$174 | 20.1\% |
| Asian | \$1,041 | \$1,087 | . $\$ 46$ | -4.2\% |

Note: Hispanics may be of any race or two or more races and are classified by both ethnicity and race. Asians do not include Pacific Islanders. Data are not available for Native Americans or those who identify with two or more races. Selfemployed workers are excluded.
Source: IWPR compilation of data from the U.S. Bureau of Labor Statistics (2015b).

[^3]
## Women's Labor Force Participation

Women's increased labor force participation represents a significant change in the U.S. economy since 1950. As of 2014, nearly six in ten women aged 16 and older ( 57.0 percent) worked outside the home (U.S. Bureau of Labor Statistics 2015a), compared with 33.9 percent in 1950 and 43.3 percent in 1970 (Fullerton 1999). Women now comprise nearly half of the U.S. labor force at 46.8 percent (U.S. Bureau of Labor Statistics 2015a). In each state, however, women are still less likely to be in the workforce than men (Table B2.1).

- Among all states, Alaska has the highest rate of women's labor force participation; 68.3 percent of women aged 16 and older work. Women in the Midwest have the strongest labor force participation rates overall: Minnesota, Nebraska, North Dakota, South Dakota, and Wisconsin all rank in the top ten. Other top ten jurisdictions include the District of Columbia, Maryland, Massachusetts, and Wyoming (Table 2.1).
- Fewer than half of women (49.3 percent) are in the labor force in West Virginia, the state with the lowest labor force participation rate of women in the nation. Southern states overall also have very low rates; Alabama, Arkansas, Florida, Kentucky, Louisiana, and Mississippi also rank in the bottom ten. Two Mountain West states-Arizona and New Mexico-and Oklahoma also fall into this group.

■ Utah has the largest difference between men's and women's labor force participation rates at 16.7 percentage points. Maine has the smallest at 5.8 percentage points (Table B2.1).

- Women's labor force participation has increased in just 11 states and the District of Columbia since 2002. Louisiana and the District of Columbia have shown the largest gains, with increases of 3.6 and 3.3 percentage points, respectively. Idaho and Minnesota have experienced the greatest losses, with declines of 5.6 and 4.8 percentage points (IWPR 2004; Table 2.1).

Among the largest racial and ethnic groups, black women aged 16 and older had the highest national workforce participation rate in 2014 at 59.2 percent. White women had the second highest labor force participation rate at 56.7 percent, followed by Hispanic women ( 56.0 percent) and Asian women (55.8). Data are not available for Native American women (U.S. Bureau of Labor Statistics 2015c).

Among the detailed racial and ethnic groups shown in Table B2.3, women of Bolivian and Peruvian descent have the highest labor force participation rates among Hispanic women at 70.1 and 66.0 percent, respectively, and women of Cuban descent have the lowest rate at 55.9 percent (Table B2.3). Women who identify as Filipino and Laotian have the highest workforce participation rates among Asian/Pacific Islander women ( 68.2 and 64.8 percent), and women who identify as Pakistani and Bangladeshi have the lowest rates ( 41.8 and 44.3 percent). Among Native American women, the Chippewa and the Pueblo have the highest workforce participation rates at 59.4 percent and 59.0 percent, respectively, and the Navajo and the Cherokee have the lowest rates ( 52.2 and 53.9 percent; Table B2.3).

Labor force participation rates also vary by age. Among women, rates are highest for those in their prime working years (aged 25-54); after increasing between 1960 and 1999, however, the labor force participation rate of women in this age group decreased nearly three percentage points between 2000 and 2014 (the labor force participation rate of men aged 25-54 declined by more than three percentage points during this time; Figure 2.6). The labor force participation rate for young women (16-24) reached its high point in 1987 and declined more than nine percentage points between 2000 and 2014,
while young men's labor force participation rate declined by more than twelve percentage points, reflecting the longer time this generation now spends in education and also a weak labor market during the Great Recession and in the slow recovery for many young adults. Among women aged 55 years and older-who are much less likely to be in the workforce than younger women-labor force participation has increased over the last three decades, especially so in the 2000s, having remained fairly constant from 1960 until the mid-198os, when the labor force participation rate of young women was growing rapidly. In 2014, 34.9 percent of older women were in the workforce, compared with 26.1 percent in 2000. Older men, in contrast, experienced a steady decline in their workforce participation rates between 1960 and the mid-199os, before their labor force participation rate increased between the mid-1990s and 2014, reaching its high point in 2012 (Figure 2.6).

Figure 2.6.
Labor Force Participation Rates by Gender and Age, 1960-2014

Source: IWPR compilation of Current Population Survey data from the U.S. Bureau of Labor Statistics (2015c).

## Part-Time Work

Although the majority of employed women and men in the United States work full-time, women are nearly twice as likely as men to work part-time ( 29.4 percent compared with 15.8 percent; Table B2.6).

Working part-time makes it less likely that a worker will receive employment benefits such as paid vacation days, paid family or medical leave, paid sick days, health care insurance, or employer contributions to retirement saving funds (Society for Human Resource Management 2011; Van Giezen 2012).

- Utah (40.2 percent), Oregon (37.1 percent), and Rhode Island (36.5 percent) have the largest percentages of employed women who work part-time.
- The District of Columbia (18.8 percent), Maryland ( 24.3 percent), and Oklahoma ( 24.5 percent) have the smallest percentages of employed women who work part-time. The percentage of employed women working part-time in the District of Columbia is roughly half that of Utah.

Women work part-time for various reasons. The majority who work part-time do so by choice (although these choices may be constrained by factors such as their children's school hours and the high costs of child care). For some women, however, part-time work is involuntary; approximately one in five women who usually worked part-time in 2013 said they worked part-time because they could not find full-time work or had their hours at work temporarily reduced (IWPR 2014b).

Whether part-time work is voluntary or not, an increasing number of workers report not knowing from one week to the next how many hours and at what times they are expected to work. They may be expected to be available for full-time work, but without any guarantee of how many hours they actually will be scheduled to work. A recent national survey of younger workers between the ages of 26 and 32 found that approximately 70 percent of hourly and non-hourly women workers experience fluctuations in their hours worked per week. Such fluctuations are particularly common for workers classified as part-time (Lambert, Fugiel, and Henly 2014). In addition to potentially creating havoc with workers' family lives, and their own and children's school schedules, these unpredictable schedules can make it hard to secure a steady income that enables them to meet their financial needs. Unpredictable scheduling also can make it difficult for workers to combine two or more part-time jobs to increase earnings or combine part-time work with their own schooling.

## Unemployment

Preliminary data from the Bureau of Labor Statistics show that in 2014, 6.1 percent of women aged 16 and older in the nation's civilian, noninstitutionalized population were unemployed, compared with 6.3 percent of men (U.S. Bureau of Labor Statistics 2015d). These unemployment rates were the lowest for women and men since 2008, when 5.4 percent of women and 6.1 percent of men were unemployed (U.S. Bureau of Labor Statistics 2014b). This decrease in unemployment reflects improvement in the nation's economy following the Great Recession that officially lasted from 2007 to 2009. The lower rates, however, may also reflect the decision of some workers to give up their active search for a job in the face of dim employment prospects (Davis 2014). As noted above, labor force participation rates have fallen, and some adults may have left the labor market out of discouragement.

In the United States, women's unemployment rates vary considerably by race and ethnicity. According to preliminary data, black women in 2014 had the highest unemployment rate among women at 10.5 percent, followed by Hispanic women ( 8.2 percent), white women ( 5.2 percent), and Asian women (4.6 percent; data are not available for Native American women). For each racial and ethnic group except Hispanics, women's unemployment rates were lower than men's (U.S. Bureau of Labor Statistics 2015e).

Single mothers and young women also have high levels of unemployment. In 2013, single mothers with children under 18 were more than twice as likely to be unemployed as married mothers with a spouse present ( 12.0 percent compared with 4.8 percent; U.S. Bureau of Labor Statistics 2014c). ${ }^{7}$ According to preliminary data for 2014, the nation's youngest female workers (aged 16-19) had an unemployment rate of 17.7 percent; those aged 20-24 fared better but still had a relatively high unemployment rate ( 10.1 percent; U.S. Bureau of Labor Statistics 2015d). Many young women face the dual disadvantage of having limited or no prior work experience and a lack of higher educational credentials.

[^4]
## The Employment and Eamings of Immigrant Women

Approximately 21 million female immigrants live in the United States, making up just over 13 percent of the nation's female population. Immigrant women come from all over the world, with the largest shares from Mexico ( 25.6 percent), the Philippines ( 5.3 percent), China ( 4.7 percent), and India ( 4.6 percent). In their multiple roles as students, professionals and other workers, spouses, parents, and caregivers, immigrant women make important contributions to local communities, the economy, and society.

- Immigrant women are less likely than U.S.-born women to be in the labor force ( 56.2 percent compared with 59.0 percent). While many immigrant women are thriving in the workforce, others encounter challenges that hinder their workforce participation or limit their access to higher quality employment. These challenges include the same barriers all women face-such as the undervaluation of work performed predominantly by women and the lack of a work-family infrastructure-and often additional challenges as well, such as limited English proficiency and, for those who are undocumented, lack of access to legal status (Hess, Henrici, and Williams 2011; Hess and Henrici 2013).
- Median annual earnings for immigrant women working full-time, year-round in 2013 were $\$ 32,000$, which was much less than the earnings for U.S.-born women ( $\$ 39,000$ ). Among the ten largest sending countries for female immigrants-Mexico, the Philippines, China, India, Vietnam, Korea, El Salvador, Cuba, the Dominican Republic, and Canada-immigrant women's earnings varied considerably. Women from India had the highest earnings at $\$ 65,000-w e l l$ above the median earnings for all women of $\$ 38,000$-and women from Mexico had the lowest earnings at $\$ 22,000$. These differences likely stem, in part, from differences in levels of education; immigrant women from India typically have more years of higher education.
- Immigrant women overall are less likely than U.S.-born women to work in managerial or professional occupations (32.7 percent compared with 41.1 percent).
- Immigrant women are disproportionately represented in service occupations. One in three (32.5 percent) immigrant women work in these occupations, compared with 19.9 percent of U.S.-born women. Immigrant women are also nearly twice as likely as U.S.-born women to work in production, transportation, and material moving occupations ( 9.9 percent compared with 5.0 percent). They are less likely than U.S.-born women to work in office and administrative support occupations ( 13.3 percent of employed immigrant women work in these occupations compared with 21.5 percent of employed U.S.-born women) and in professional and related occupations (21.8 percent compared with 27.0 percent).

IWPR calculations based on 2013 American Community Survey microdata.

## The Employment and Eamings of Women with Disabilities

Approximately 2.6 million women aged 16 and older in the labor force have disabilities, including cognitive, ambulatory, sight, hearing, and self-care or independent living difficulties. They are 3.6 percent of all women in the labor force.

- The labor force participation rate of women aged 16 and older with disabilities in 2013 was 17.1 percent, compared with 62.7 percent of women without disabilities.
- Finding work is harder for women with a disability than for other women. In 2013, the rate of unemployment for women with a disability was 13.5 percent, compared with 6.8 percent for women without a disability.
- Women with disabilities are more likely to work part-time. The percentage of women with disabilities working part-time in 2013 was 38.4 percent, compared with 28.9 percent of women without disabilities.
- Women with disabilities are about as likely as other women to work in sales and office occupations (31.8 and 30.4 percent, respectively) and slightly more likely to work in service occupations (24.8 and 21.6 percent). They are less likely to work in management, professional, and related occupations ( 34.9 percent of women with disabilities and 41.8 percent of women without disabilities).
- Women aged 16 and older with disabilities who work full-time, year-round report lower earnings than those without disabilities ( $\$ 32,500$ compared with $\$ 38,000$ ).

Earnings data and data on part-time work are based on IWPR analysis of 2013 American Community Survey microdata; all other data are from the U.S. Bureau of Labor Statistics (2014d).

## Gender Differences in Employment by Industry

In the United States, gender differences persist across industries. An industry encompasses all employees of a firm or organization, whether they work as a janitor, secretary, accountant, or information technology specialist. Employment in services such as health care, nongovernmental education, leisure, and other services account for more than four in ten women's jobs (nationally 43.2 percent), but only one in four men's jobs ( 24.8 percent; Table 2.4). The construction industry ( 1.3 percent of women and 11.1 percent of men), manufacturing ( 6.6 percent of women and 14.4 percent of men), and transportation and communications (3.0 percent of women and 7.8 percent of men) together account for the jobs held by only one in nine employed women but almost one-third of those held by employed men (Table 2.4).

The different industries in which women and men work affect their economic status. During the Great Recession of 2007 to 2009, for example, job losses were particularly high in construction and manufacturing while jobs in health and education grew, resulting in differences in the size and timing of job losses and gains experienced by women and men (Hartmann and English 2010). In the five years
after the official end of the Great Recession in June 2009, jobs in health care and education grew by almost two million, benefitting mainly women, while jobs in construction grew by only 7,000 (with net growth only for men; Hartmann, Shaw, and O'Connor 2014).

Note: For employed women and men aged 16 and older; earnings data are for full-time, year-round workers. All public sector workers are in "government"; other workers are private sector employees.
Source: IWPR analysis of American Community Survey microdata (Integrated Public Use Microdata Series, Version 5.0).

Median annual earnings and the gender earnings ratio for full-time, year-round work differ substantially across industries. Women in government (which includes federal government as well as state and local services such as police and education) have the highest median earnings ( $\$ 45,000$ ) and a narrower gender earnings ratio than the one for all women and men ( 83.3 compared with 79.2 percent; Table 2.4). Among the industries shown in Table 2.4, the gender earnings ratio is widest in finance, insurance, and real estate ( 61.8 percent) and narrowest in mining and construction (95.2 percent), an industry that employs proportionately far fewer women than men. Manufacturing provides middle income jobs to women, with median annual earnings of $\$ 37$, ooo, but median earnings for men in these jobs are substantially higher at $\$ 50,000$ (resulting in a gender wage ratio of 74.0 percent).

- The share of employed women who work in government, the best paying industry for women, is highest in Wyoming (29.2 percent) and lowest in Pennsylvania (11.9 percent; Table B2.7).
- Employed women are the most likely to work in finance, insurance, and real estate-the industry with the widest gender earnings ratio-in Delaware ( 11.5 percent), and least likely to work in this industry in Alaska (4.0 percent).
- In four states-Indiana and Wisconsin (11.4 percent each), Iowa (10.4 percent), and Michigan (10.1 percent)—at least one in ten employed women work in manufacturing (Table B2.7).

## Gender Differences Across Occupations

Nationally, 39.9 percent of employed women and 33.0 percent of employed men work in professional or managerial occupations (Table B2.1). This category encompasses a range of occupations-from management, lawyers, doctors, nurses, teachers, and accountants to engineers and software developers-that mostly require at least a college degree. The percentage of employed women working in these occupations has increased since the 2004 Status of Women in the States report, when 33.2 of working women held professional or managerial jobs. These jobs offer opportunities for higher earnings for women, although typically even more so for men; women who work in managerial or professional occupations often earn substantially less than men (Table 2.5). The three jurisdictions with the highest shares of women working in professional or managerial occupations-the District of Columbia, Maryland, and Massachusetts-also have the highest median annual earnings for women (Table 2.1).

Women are much more likely than men to work in professional and related occupations (26.2 compared with 17.5 percent, respectively) but slightly less likely than men to work in management, business, and financial occupations ( 13.7 compared with 15.4 percent; Table 2.5). Women are also much more likely than men to work in service occupations (Table 2.5), which include personal care aides, home health aides, nursing assistants, cooks, and food service staff-occupations that are projected to see high growth in the coming years, but which have median annual earnings for women of less than $\$ 25,000$ per year (Table 2.5). According to IWPR analysis of 2013 American Community Survey microdata, one-third of employed Hispanic women ( 32.2 percent) and more than one in four employed black ( 28.2 percent) and Native American ( 27.4 percent) women work in service occupations, compared with 20.6 percent of Asian/Pacific Islander women and 18.3 percent of white women. ${ }^{8}$

Nevada has the highest proportion of women working in service occupations ( 28.8 percent of employed women). In six other states-Louisiana, Montana, New Mexico, North Dakota, West Virginia, and Wyoming-one-quarter of employed women work in service occupations (Table B2.8).

- Women are least likely to work in service occupations in the District of Columbia (16.2 percent), New Hampshire (18.7 percent), and Utah (19.4 percent).

## Women in STEM Occupations

Science, technology, engineering, and mathematics (STEM) occupations have experienced much faster growth than other occupations in the last decade and play a key role in the sustained growth and stability of the U.S. economy (U.S. Department of Commerce 2011). These fields are among the higher paid; IWPR analysis of 2013 American Community Survey microdata indicates that in 2013, median annual earnings in STEM occupations were $\$ 64$, ooo for women and $\$ 78$, ooo for men. ${ }^{9}$ Yet, women are less likely to go into STEM fields than men; only 4.6 percent of women work in STEM occupations, compared with 10.3 percent of men (Table B2.9).

The percentage of women working in STEM occupations varies across the largest racial and ethnic groups. IWPR analysis of American Community Survey microdata finds that Asian/Pacific Islander women are the most likely to work in these occupations (11.3 percent of employed Asian/Pacific Islander women), followed by white women ( 4.9 percent), black women ( 2.8 percent), and Native American and Hispanic women (2.3 percent each).

- Women are most likely to work in STEM occupations in the District of Columbia ( 10.6 percent), Maryland ( 7.5 percent), and Massachusetts (7.0 percent; Table B2.9), the three states with the highest median annual earnings for women (Table 2.1).

[^6]- Women are least likely to work in STEM occupations in South Dakota (2.6 percent), Mississippi (3.1 percent), and Louisiana (3.2 percent).
- Nationally, women are 28.8 percent of STEM workers. Women are less likely than men to work in STEM occupations in every state, but their shares of STEM occupations vary considerably (Table B2.9).
- Women make up the highest share of STEM workers in the District of Columbia (44.2 percent), followed by Maryland (34.4 percent), Vermont ( 33.6 percent), and Wyoming ( 33.0 percent).
- Women are less than one-quarter of STEM workers in two states: Utah ( 23.5 percent) and New Hampshire (24.6 percent).

The differences in occupations in which women and men work are just one factor indicating that much more progress needs to be made before women can achieve equality in the workforce. Occupational segregation continues to be a persistent feature of the U.S. labor force, with the occupations in which women are concentrated paying less than those in which men are concentrated. Women's participation in the labor force has declined since 2002, and women in all states across the nation continue to earn less than men. In addition, despite signs of progress, the gender wage gap is not expected to close nationally until 2058 if progress continues at the current rate since 1960 (and not until a full century later in Wyoming, the last state expected to close the gap). These findings point to the need for policies and practices that can accelerate the pace of change for women and improve their status in the area of employment and earnings in all states and the nation overall.

## Appendix A. Methodology

To analyze the status of women in the states, IWPR selected indicators that prior research and experience have shown illuminate issues that are integral to women's lives and that allow for comparisons between each state and the United States as a whole. The data in IWPR's Status of Women in the States reports come from federal government agencies and other sources; many of the figures rely on analysis of the U.S. Census Bureau's American Community Survey (ACS) from the Minnesota Population Center's Integrated Public Use Microdata Series (IPUMS). Much of the analysis for IWPR's 1996-2004 Status of Women in the States reports relied on the Current Population Survey (CPS).

The tables and figures present data for individuals, often disaggregated by race and ethnicity. In general, race and ethnicity are self-identified; the person providing the information on the survey form determines the group to which he or she (and other household members) belongs. People who identify as Hispanic or Latino may be of any race; to prevent double counting, IWPR's analysis of American Community Survey microdata separates Hispanics from racial categories-including white, black (which includes those who identified as black or African American), Asian/Pacific Islander (which includes those who identified as Chinese, Japanese, and Other Asian or Pacific Islander, including Native Hawaiians), or Native American (which includes those who identified as American Indian or Alaska Native). The ACS also allows respondents to identify with more specific racial groups and/or Hispanic origins. Detailed racial/ethnic information is available for American Indians and Alaska Natives, Asian/Pacific Islanders, and Hispanics, but not for blacks or whites. IWPR conducted analysis of selected indicators for the groups for which detailed information is available (when sample sizes were not large enough, detailed races/ethnicities were combined into "other" categories based on their corresponding major racial or ethnic group). Published data from the Bureau of Labor Statistics that are cited in the text do not include Pacific Islanders and classify Hispanics in the racial groups with which they identify as well as separately, and in the data that come from these datasets Hispanics are double counted.

When analyzing state- and national-level ACS microdata, IWPR used 2013 data, the most recent available, for most indicators. When disaggregating data at the state level by race and ethnicity, analyzing median annual earnings for young women by state, and analyzing the employment and earnings of women by detailed racial and ethnic group nationally, IWPR combined three years of data (2011, 2012, and 2013) to ensure sufficient sample sizes. IWPR constructed a multi-year file by selecting the 2011, 2012, and 2013 datasets, adjusting dollar values to their 2013 equivalents using the Consumer Price Index for All Urban Consumers, and averaging the sample weights to represent the average population during the three year period. Data on median earnings are not presented if the unweighted sample size is less than 100 for any cell; data on other indicators are not presented if the average cell size for the category total is less than 35 .

Earnings lost over time due to the gender wage gap were estimated by comparing the median annual earnings of women and men who worked full-time, year-round using the 1980-2014 CPS Annual Social and Economic Supplements (ASEC). Birth year was estimated by subtracting age from the year of the survey data collection. Earnings were adjusted to 2014 dollars using the CPI-U. The differences in earnings between women and men by single year of age were calculated within five-year birth cohorts and summed to calculate the cumulative losses for all women and for women with a bachelor's degree or higher.

IWPR used personal weights to obtain nationally representative statistics for person-level analyses. Weights included with the IPUMS ACS for person-level data adjust for the mixed geographic sampling rates, nonresponses, and individual sampling probabilities. Estimates from IPUMS ACS samples may not be consistent with summary table ACS estimates available from the U.S. Census Bureau due to the additional sampling error and the fact that over time, the Census Bureau changes the definitions and classifications for some variables. The IPUMS project provides harmonized data to maximize comparability over time; updates and corrections to the microdata released by the Census Bureau and IPUMS may result in minor variation in future analyses.

## Differences Between the ACS and the CPS

The differences between the ACS and CPS and their impact on measures of employment and earnings are described in detail in Kromer and Howard (2011). These differences have some bearing on this report's comparisons with data from IWPR's 2004 report, as well as on the reported differences in data for 2013 that come from the two surveys. While both the ACS and the CPS survey households, their sample frames also include noninstitutionalized group quarters, such as college dorms and group homes for adults. The ACS also includes institutionalized group quarters, such as correctional facilities and nursing homes. College students away at school and living in a dormitory are treated differently in the two surveys. In the ACS they would be residents of the dorm in the group quarters population while in the CPS they remain a member of their family household. While all CPS interviews are collected using computer-assisted interviews, about half of the ACS households respond using the paper mail-back form and half by computer-assisted interview (Census Bureau 2014). The ACS collects data on work and earnings in the previous 12 months throughout the year while the CPS-ASEC collects work and earnings information for the previous calendar year during interviews collected FebruaryApril each year. Finally, the two surveys have differences in wording of some questions that aim to collect similar social and demographic information.

## Calculating the Composite Index

To construct the employment and earnings composite index, each of the four component indicators was first standardized. For each of the indicators, the observed value for the state was divided by the comparable value for the entire United States. The resulting values were summed for each state to create a composite score. Each of the four component indicators has equal weight. The states were ranked from the highest to the lowest scores.

To grade the states on this composite index, values for each of the components were set at desired levels to provide an "ideal score." Women's earnings were set at the median annual earnings for men in the United States overall; the wage ratio was set at 100 percent, as if women earned as much as men; women's labor force participation was set at the national number for men; and women in managerial or professional occupations was set at the highest score for all states. Each state's score was compared with the ideal score to determine the state's grade.

WOMEN'S MEDIAN ANNUAL EARNINGS: Median annual earnings of women aged 16 and older who worked full-time, year-round ( 50 or more weeks per year and 35 or more hours per week) in 2013. The sample size for women ranged from 713 in Alaska to 44,866 in California. These earnings data have not been adjusted for cost-of-living differences between the states because the federal government does not produce an index of such differences. Source: Calculations of 2013 American Community Survey microdata as provided by the Integrated Public Use Microdata Series (IPUMS) at the Minnesota Population Center.

RATIO OF WOMEN'S TO MEN'S EARNINGS: Median annual earnings of women aged 16 and older who worked full-time, year-round ( 50 or more weeks per year and 35 or more hours per week) in 2013
divided by the median annual earnings of men aged 16 and older who worked full-time, year-round in 2013. Sample sizes ranged from 713 in Alaska to 44,866 in California for women's earnings, and from 1,074 in Alaska to 62,903 in California for men's earnings. Source: Calculations of 2013 American Community Survey microdata as provided by the Integrated Public Use Microdata Series (IPUMS) at the Minnesota Population Center.

WOMEN'S LABOR FORCE PARTICIPATION (proportion of the adult female population in the labor force): Percent of women aged 16 and older who were employed or looking for work in 2013. This includes those employed full-time, part-time voluntarily, or part-time involuntarily, and those who are unemployed but looking for work. The percent of women in the labor force in IWPR's 1996-2004 Status of Women in the States reports included the civilian, noninstititutionalized population. Source: Calculations of 2013 American Community Survey microdata as provided by the Integrated Public Use Microdata Series (IPUMS) at the Minnesota Population Center.

WOMEN IN MANAGERIAL AND PROFESSIONAL OCCUPATIONS: Percent of women aged 16 and older who were employed in executive, administrative, managerial, or professional specialty occupations in 2013. Source: Calculations of 2013 American Community Survey microdata as provided by the Integrated Public Use Microdata Series (IPUMS) at the Minnesota Population Center.

| United States | 29.4\% |  | 15.8\% |  | 62.2\% |  | 74.8\% |  |

Note: Aged 16 and older. Part-time includes those who usually work fewer than 35 hours per week. Full-time, year-round includes those who work at least 35 hours per week, for at least 50 weeks per year. Percentages of part-time and full-time, year-round workers do not sum to 100 because those who work full-time but less than year-round are not included. Part-time workers may work either part-year or full-year.

| United States | 4.6\% |  | 10.3\% |  | 28.8\% |  |

Notes: Aged 16 and older. This definition of STEM occupations follows the U.S. Bureau of Labor Statistics definition of STEM occupations, which includes the social sciences and managerial occupations in social science fields, but excludes support occupations, health occupations, and most technical and trade occupations that do not require a four-year degree.

[^0]:    ${ }^{1}$ The earnings estimate for 2013 is based on the Current Population Survey (CPS), the official dataset for national earnings, and the same dataset used for the 2002 estimate. It differs from earnings estimates based on the American Community Survey (ACS), the primary dataset used in this report. IWPR's national estimate of median annual earnings for full-time, year-round workers based on analysis of the ACS is $\$ 38,000$ for women and $\$ 48,000$ for men in 2013. This report relies on the ACS because the ACS's larger sample size makes it possible to provide data disaggregated by age and race/ethnicity on women's earnings at the state level. Differences in estimates based on the ACS and CPS may be due to the use of different reference periods for reporting annual earnings as well as differences in the method of data collection and the types of households surveyed (see Appendix A for more information). Earnings estimates based on the CPS are for the population aged 15 and older; IWPR's estimates based on analysis of the ACS are for the population aged 16 and older.
    ${ }^{2}$ Both the 2004 and 2014 estimates are based on the CPS; estimates based on the ACS differ slightly. IWPR's estimates of labor force participation in 2013 based on analysis of the ACS are 58.6 percent for women aged 16 and older and 68.9 percent for men (see Table B2.1). The Bureau of Labor Statistic's estimates for 2013, based on the CPS, are 57.2 percent for women and 69.7 percent for men aged 16 and older. Differences based on the ACS and CPS may be due to different time periods for reporting labor force activity as well as sampling variability, questionnaire structure, and mode of data collection.

[^1]:    ${ }^{3}$ The comparatively high earnings of women in some states are, to some extent, offset by higher costs of living in these areas. In general, places such as the District of Columbia, New England, Alaska, Hawaii, and the West Coast have higher costs of living than the Midwestern and Southern states (Missouri Economic Research and Information Center 2015).
    ${ }^{4}$ Earnings estimate for 1980 is for the civilian workforce only.

[^2]:    ${ }^{5}$ For additional IWPR data on the employment and earnings of millennial women, see the March 2015 issue of Glamour Magazine, pp. 274-277.

[^3]:    ${ }^{6}$ Earnings are calculated for all workers and are not controlled for education or sector of employment; when controlled for these factors, the union advantage is smaller but still significant, especially for women and minorities (Jones, Schmitt, and Woo 2014).

[^4]:    ${ }^{7}$ Single mothers include those who are never married, married with an absent spouse, divorced, separated, or widowed.

[^5]:    ${ }^{8}$ Although the share of Asian/Pacific Islander women overall who work in service occupations is slightly lower than the national average for all women, there is considerable variation among Asian/Pacific Islander groups. For example, three in ten (30.4 percent) Vietnamese workers are employed in service occupations ( 30.4 percent), compared with less than one in ten (6.7 percent) Indian workers. Data are not available by gender (U.S. Department of Commerce 2015).

[^6]:    ${ }^{9}$ This analysis uses the Bureau of Labor Statistics' definition of STEM occupations, which includes the social sciences and managers of STEM workers, but excludes support occupations, health occupations, and most technical and trade occupations that do not require a four-year degree (U.S. Bureau of Labor Statistics 2012). Rothwell (2013) and Carnevale, Smith, and Melton (2011) also find a wage advantage for STEM related occupations not requiring a four-year degree.

[^7]:    Note: For employed women aged 16 and older. All public sector workers are included in government; other sectors are private sector only.
