

CHAPTER 3

THE STATUS OF WOMEN IN THE STATES: 2015

Work & Family

Introduction

Women make up almost half of the workforce. Few families have someone who can stay at home to take care of health emergencies, pick children up from school and supervise homework, or take an elderly parent to a doctor's appointment. In half of all families with children, women are the primary or co-breadwinner¹ (IWPR 2015). Low-income families are particularly likely to have all parents in the labor force (Boushey 2014). Yet, as mothers' labor force participation has dramatically increased in the past decades (U.S. Bureau of Labor Statistics 2014) and the number of women and men aged 50 and older who provide care for a parent more than tripled between 1994 and 2008 (MetLife 2011)², the development of an infrastructure to support workers with family caregiving responsibilities has been largely neglected. Many workers lack access to even the most basic supports such as earned sick days and job-protected paid parental leave. Quality child care is also out of reach for many families because it is not affordable. Women are the large majority of family caregivers,³ and in the absence of reliable family supports, too many women are forced to make difficult decisions between keeping their jobs and caring for their family members.

Best and Worst States on Work & Family

State	Rank	Grade
New York	1	B
California	2	B
District of Columbia	3	B
New Jersey	4	B-
Rhode Island	5	B-
Indiana	51	F
Utah	50	F
Montana	49	F
Mississippi	48	D-
Wyoming	47	D-

Investments in work-family supports not only improve women's economic security, but also contribute to economic growth (Council of Economic Advisors 2014). This chapter examines available supports for work and family at the state level. It begins with an overview of the Work & Family Composite Index and the overall ranking of

¹ A primary or co-breadwinner is defined as a single mother, or as a married mother with children under 18 who earns at least 40 percent of a couple's total earnings; see Appendix A3 for a more detailed discussion of the breadwinner analysis.

² The large majority of family caregivers aged 50 to 64 are employed (MetLife 2011).

³ In this chapter, the term "family caregiver" will be used to describe someone providing unpaid care to a family member. A person paid to provide such care will be described as a "domestic care worker."

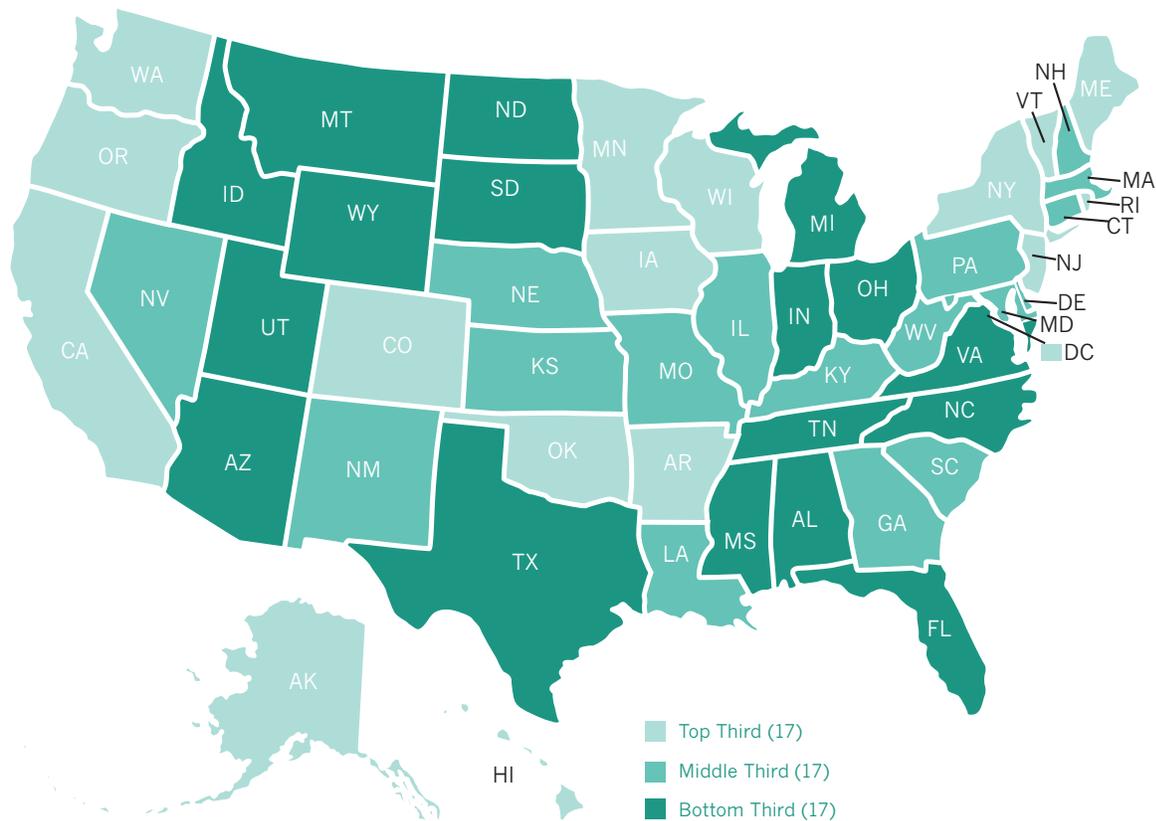

states in this area of women’s status. It then discusses paid leave, elder and dependent care, motherhood and work and female breadwinners, and child care and preschool education. The chapter ends with a discussion of differences in the time spent on paid and unpaid work between mothers and fathers.

The Work & Family Composite Score

The Work & Family Composite compares states’ performance across three components of work-family policy—paid leave, dependent and elder care, and child care—and a fourth component, the gender gap in the labor force participation of parents of children under six, an indicator that highlights gender inequality in family care of young children. This is the first IWPR *Status of Women in the States* report to include the Work & Family Composite (see Map 3.1). Each of the three policy components has a number of indicators selected to represent the ease or difficulty of obtaining work family supports.

The paid leave component includes state policies on Temporary Disability Insurance (TDI), paid family and medical leave, and paid sick days. For dependent and elder care, the component includes the availability of unemployment insurance benefits for a worker who has to leave employment for family care reasons; the availability and level of dependent care tax credits for the care of a dependent adult relative; and the delegation of long-term support services to domestic care agency staff (such delegation can lower the costs of providing care for a family member). The child care component includes three indicators, enrollment of four-year-olds in publicly funded pre-kindergarten (Pre-K), preschool special education, and state and federal Head Start programs, state systems to ensure quality of Pre-K education, and the cost of center-based infant care. The indicator selection is intended to provide a succinct portrait rather than a comprehensive catalogue of all aspects of work and family; the selection of indicators is also informed by the availability of data for state-by-state comparisons.

Map 3.1. Work & Family Composite Index

Note: For methodology and sources, see Appendix A3. Calculated by the Institute for Women’s Policy Research.

Table 3.1.

How the States Measure Up: Women's Status on the Work & Family Composite Index and Its Components

Notes: ^aFor mothers and fathers with children younger than age six. The gap is measured as fathers' labor force participation rate minus mothers' labor force participation rate. See Appendix A3 for methodology and sources. For additional detail on the components of the indicators, see Appendix Tables B3.1-B3.4. Calculated by the Institute for Women's Policy Research.

Each of the four components of the Work & Family Composite Index, or indices, is weighted equally. Out of a maximum score of 8 across all indices, state composite scores range from a low of 2.03 to a high of 5.55, with higher scores reflecting a stronger performance in this area of women's status and receiving higher letter grades (Table 3.1).

- New York, California, and the District of Columbia have the highest scores on the Work & Family Composite Index, which reflects, in part, high rankings on paid leave. None of the best-ranking states, however, consistently ranks in the top ten states for each of the four component indices.
- Indiana, Montana, and Utah have the worst scores on the Work & Family Composite Index overall.
- Four states in the Northeast—Maine, New Jersey, New York, and Rhode Island—rank among the best ten on the Work & Family Composite Index. Other jurisdictions in the group include Arkansas, California, the District of Columbia, Iowa, Minnesota, and Oregon.
- Four Mountain West states—Idaho, Montana, Utah, and Wyoming—rank in the bottom ten. They are joined by Florida, Indiana, Michigan, Mississippi, North Dakota, and Virginia.
- No state received a grade higher than a B on the Work & Family Composite Index. California, New York, and the District of Columbia received a B, and New Jersey, Rhode Island, and Oregon a B-. Three states—Indiana, Utah, and Montana—each received an F.

Paid Leave and Paid Sick Days

Everyone is likely to need to take leave from work at some time due to personal illness, the demands of parenthood, or the need to provide care for someone in their family. Because women are the majority of those

providing care for children as well as elderly and disabled adult family members, and because of their greater need for leave related to pregnancy and childbirth, having access to job-protected paid leave is particularly important for them. Research has documented the benefits of paid leave for women and their families and the negative effects of not having access to leave.⁴ Paid leave helps women remain in the labor force when faced with caregiving responsibilities—whether the caregiving is for a baby, child, parent, or spouse—and the continuous attachment to the labor force can also help them advance in their careers. Paid leave for men can help address the unequal division of caregiving tasks between women and men and can reduce the potential for stereotyping and discrimination against women if they are the only ones making use of paid leave benefits (Patnaik 2015). The United States is one of only two countries in the world without a national paid maternity leave law, and one of a small minority of high-income countries that does not require employers to provide paid sick days (Earle, Mokomane, and Heymann 2011; International Labour Organisation 2014; Ray, Sanes, and Schmitt 2013).

The Family and Medical Leave Act (FMLA) of 1993 provides up to 12 weeks of unpaid, job-protected leave in a given year to care for a newborn or a newly adopted or fostered child, to address one's own serious health condition, or to care for a family member with a serious health condition; 26 weeks of leave are available for care of an injured service member (Gault et al. 2014). Because of restrictions in coverage to employees working for public and private employers with 50 or more employees within 75 miles of their worksite, and who have worked at least 1,250 hours in the past year, only 59 percent of employees are eligible to take FMLA leave (Klerman, Daley, and Pozniak 2014). Coverage is also restricted because of the law's narrow definition of family. Spouses (including same-sex spouses⁵), children, grandchildren, and parents are included, but care for an adult child (unless mentally or physically disabled), sibling, parent-in-law, or grandparent is not.

⁴ Reviews of the research on parental leave are available in Gault et al. 2014; Earle, Mokomane, and Heymann 2011; and Winston 2014.

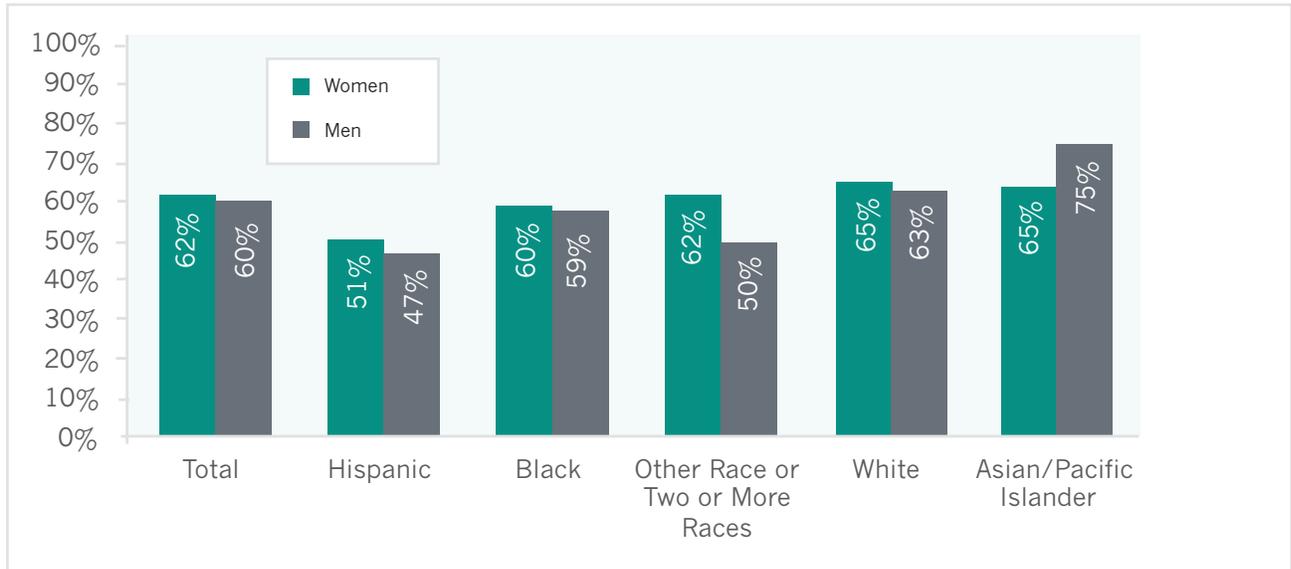

⁵ On February 25, 2015, the U.S. Department of Labor issued a "Final Rule" on the FMLA to clarify that legally married same-sex spouses are entitled to take FMLA leave to care for their spouse irrespective of the legal recognition of same-sex marriage in their state of residence (U.S. Department of Labor, WHD 2015a).

State Laws That Expand Family and Medical Leave Coverage

- Expanding access to workers in smaller businesses: As of 2014, six states—Maine, Maryland, Minnesota, New Jersey, Oregon, and Vermont—and the District of Columbia had expanded Family and Medical Leave eligibility to workers of smaller businesses, ranging from those with at least 15 employees within 75 miles of the worksite in Maine, Maryland, and Vermont to 50 employees worldwide in New Jersey (Gault et al. 2014; National Partnership for Women & Families 2014a).
- Expanding access for pregnant workers: As of 2014, nine states—California, Connecticut, Hawaii, Iowa, Louisiana, Massachusetts, Montana, New Hampshire, and Washington—had expanded FMLA eligibility to workers of smaller businesses in cases of pregnancy only, ranging from those with any number of employees in Hawaii and Montana to those with at least 25 employees in Louisiana (Gault et al. 2014; National Partnership for Women & Families 2014a).
- Expanding the length of job-protected leave: As of 2014, legislation in four states—Connecticut, Oregon, Rhode Island, and Tennessee—and the District of Columbia extended leave for private sector employees beyond 12 weeks, ranging from 16 weeks in Connecticut and the District of Columbia to 30 weeks in Rhode Island. An additional 11 states—Alaska, Colorado, Florida, Illinois, Massachusetts, New York, North Carolina, Pennsylvania, Vermont, Washington, and Wisconsin—provided more than 12 weeks of leave for state employees. Three states—California, Oregon, and Washington—and the District of Columbia provided additional leave for birth mothers (National Partnership for Women & Families 2014a).
- Including same-sex partners and spouses in the definition of family: In ten states—California, Colorado, Connecticut, Hawaii, Maine, New Jersey, Oregon, Vermont, Washington, Wisconsin—and the District of Columbia, same-sex partners or spouses were explicitly included in the definition of family (National Partnership for Women & Families 2014a).
- Broadening the definition of family: In five states—California, Minnesota, Oregon, Rhode Island, and Washington—leave can be taken to care for a grandparent. In six states—California, New Jersey, Oregon, Rhode Island, Vermont, and Washington—leave can be taken to care for a parent-in-law. In California and Maine, leave can be taken to care for a sibling (Gault et al. 2014).

Figure 3.1.

Percent of Workers with Access to Paid Sick Days by Gender and Race/Ethnicity, United States, 2013

Notes: Percent with access to paid sick days is calculated for employed individuals aged 18 years and older. Racial categories are non-Hispanic. Hispanics may be of any race or two or more races. Native Americans are included in "other race or two or more races"; sample sizes are insufficient to report estimates for Native Americans separately.
Source: O'Connor, Hayes, and Gault 2014.

State laws and voluntary employer benefits are only partially filling the vacuum left by a lack of federal laws. Nearly 40 percent of all women workers, and about half of Hispanic women workers, do not have access to any paid sick time (Figure 3.1). Part-time workers (the majority of whom are women) are only rarely covered by paid leave benefits of any kind (Figure 3.2). Less than half of all employed women (41 percent) received paid maternity leave before or after the birth of their child (Laughlin 2011).

Access to paid leave is highly unequal. Nine in ten high-income workers have access to paid sick time, compared with only one in five low-income workers (O'Connor, Hayes, and Gault 2014). Fifty-three percent of lower-income workers did not receive pay during their most recent FMLA leave, compared with just 18 percent of higher-paid workers who received paid leave as part of their employers' benefit package (Klerman, Daley, and Pozniak 2014). Nearly half of all employees (46 percent) who reported that they needed leave for FMLA reasons in 2012 reported not having been able to take it because

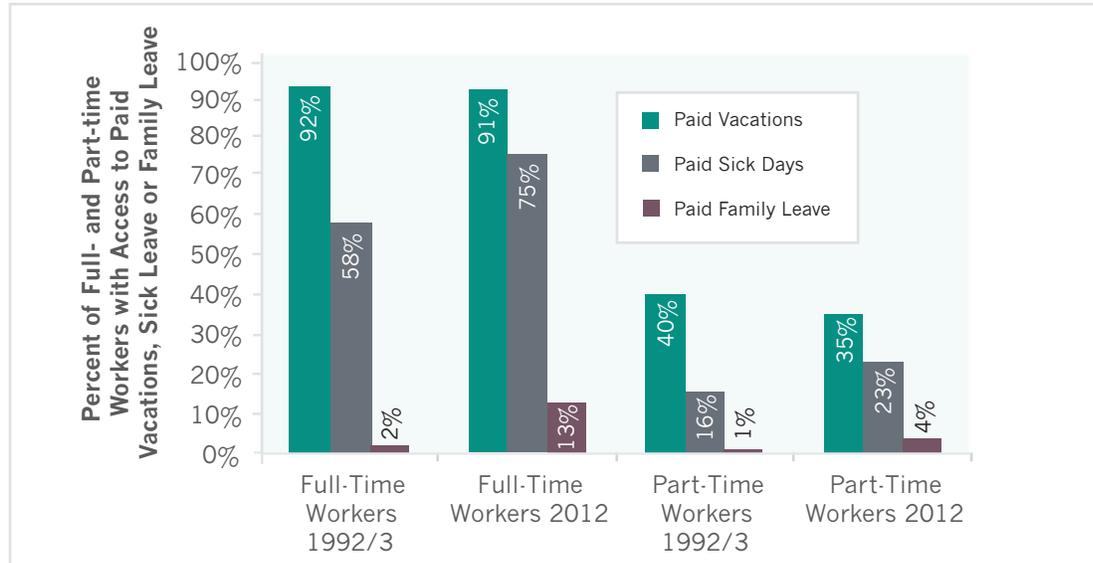

the leave would have been unpaid, and they could not forego the earnings (Klerman, Daley, and Pozniak 2014).

A small but growing number of states have statutes providing workers access to paid leave, with seven states providing some kind of leave as of early 2015. The Work & Family Composite Index scores states on three paid leave policies: statewide Temporary Disability Insurance, or TDI (which provides women with paid maternity leave of four to six weeks for a normal pregnancy and birth as part of providing TDI to all workers with temporary disabilities); paid family leave insurance (which covers the care of newborns and care of family members with illness or aging parents, of the type covered under the FMLA for up to four to six weeks), and paid sick days.

- California ranks highest on paid leave; it is the only state in which workers are covered by TDI and family leave insurance (up to six weeks of paid family leave) and have a right to earn paid sick days (paid for by employers). New Jersey and Rhode Island rank second

Figure 3.2.

Percent with Access to Employer Provided Paid Leave Benefits for Full-Time and Part-Time Workers, 1992/3 and 2012

Notes: Private employers only. National Compensation Survey data for 1992 and 1993 were combined to create a sufficient sample for analysis. Source: IWPR compilation of data from Van Giezen 2013.

and third, respectively. Both have statewide TDI and paid family leave insurance, and several cities in New Jersey have passed paid sick days laws. In Rhode Island, all private sector workers, irrespective of the size of their employer, have job protection while they are on paid family leave (National Partnership for Women & Families 2014a and 2014b).

- Four additional states and the District of Columbia provide the right to at least one type of paid leave: Hawaii and New York both offer TDI leave,⁶ and Connecticut (albeit in a legislative framing that leaves

a large number of workers uncovered), Massachusetts, and the District of Columbia require employers to provide paid sick days. Three additional states—Oregon, Pennsylvania, and Washington⁷—include at least one city or district requiring that employers provide paid sick days.

- In 40 states workers lack statutory rights to paid family and medical leave and do not have a statutory right to paid sick days on the job (Appendix Table B3.1; Map 3.2).

⁶ Benefits provided through the TDI State Fund in New York, however, are very low, at an average wage replacement of only \$170 per week (U.S. Social Security Administration 2014, Table 9c1).

⁷ Washington also passed the State Family Leave Act in 2007, but its implementation has been indefinitely postponed.

age 65 and older has grown from 9.9 percent in 1970 to 14.1 percent in 2013 and is projected to reach 20 percent in 2030 (West et al. 2014; U.S. Census Bureau 2012a)—the demand for informal care will continue to increase, with proportionately fewer family members available to provide such care.⁹

Nationally, in 2011–2013 one in seven adult women under the age of 65 lived with a person aged 15 or older with one or more disabilities (Table 3.2).¹⁰ The share of women who live with someone with one or more disabilities varies considerably between states, from fewer than one in ten women under the age of 65 in Nebraska (9.8 percent) and North Dakota (9.6 percent) to one in five women in West Virginia (20.9 percent) and Mississippi (19.3 percent; Table 3.2).

The National Alliance for Caregivers and AARP study (2009) found that, on average, caregivers spent 20 hours per week providing care, rising to almost 40 hours per

week for those who lived with the person who needed care. The weekly time spent is not much lower for those who are employed: the 2014 Older Adult Caregiver Study found that adults who worked full-time while providing care for someone aged 50 and older spent a median of 16 hours per week on such care (Matos 2014). Time spent on support for parents and in-laws is twice as high for families living in poverty than it is for high-income families (Heymann 2005).

Balancing both employment and caregiving responsibilities, particularly for women, leads to significantly higher levels of stress than those experienced by noncaregiving peers (MetLife 2011). This effect may be even stronger for people with elder care responsibilities, as elder care needs may arise more suddenly and intensively, because of a fall or a stroke, for example, than care for a child, making it harder to plan and prepare (Reinhard et al. 2011). The unequal division of family caregiving work between women and men is demonstrated by the fact

Table 3.2.
Women Living with a Person with a Disability, 2013

State	Percent	State	Percent	State	Percent
Alabama	18.0%	Kentucky	18.5%	North Dakota	9.6%

United States	14.4%				

Notes: Data are three-year (2011–2013) averages for women aged 16 to 64. Persons with one or more disabilities are aged 15 and older and need assistance with one or more of the following: hearing; vision; cognitive tasks because of difficulty remembering, concentrating, or making decisions; walking or climbing stairs; bathing or dressing; and doing errands such as visiting a doctor's office or shopping because of a physical, mental, or emotional problem.
Source: IWPR analysis of American Community Survey microdata (Integrated Public Use Microdata Series, Version 5.0).

⁹ According to a 2014 study, 55 percent of employed adults aged 18 and older had provided care for at least one person aged 65 or older during the last five years; 8 percent only provided care for someone aged 50 to 64; and 37 percent had not provided care for someone aged 50 or older (Matos 2014).

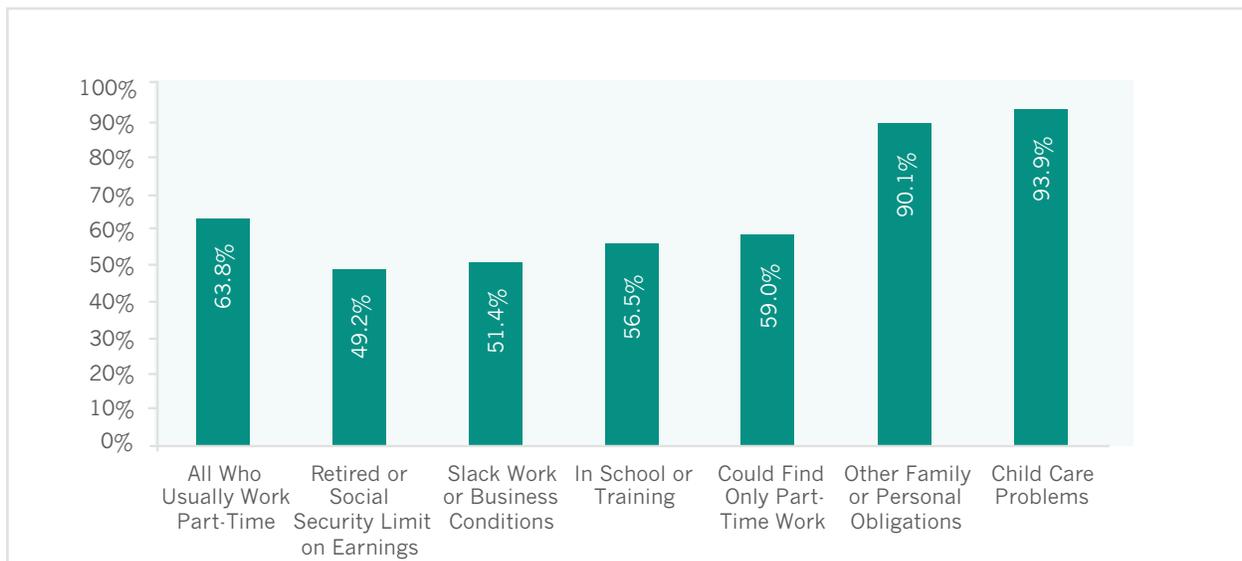

¹⁰ The ACS defines a person with a disability as someone who has one or more of the following: hearing difficulty; vision difficulty; cognitive difficulty (having difficulty remembering, concentrating, or making decisions because of a physical, mental, or emotional problem); having serious difficulty walking or climbing stairs; having difficulty bathing or dressing; independent living difficulty (having difficulty doing errands alone such as visiting a doctor's office or shopping because of a physical, mental, or emotional problem; U.S. Census Bureau 2012b). A similar methodology is used by the Bureau of Labor Statistics in the CPS (U.S. Bureau of Labor Statistics 2012).

that women are nine times as likely as men to work part-time for family care reasons (Figure 3.3). Part-time work means lower earnings (and lower Social Security contributions) than full-time work; part-time workers are also much less likely than full-time workers to have access to paid leave of any kind or to benefit from employer contributions to employer-provided health insurance or pension plans (SHRM 2011; Van Giezen 2013). Women are also three times as likely as men to report having left their job because of caregiving responsibilities (6 percent compared with 2 percent respectively, according to a 2013 AARP survey of people aged 45 to 74; Perron 2014). A study by MetLife (2011) estimated that women with caregiving responsibilities who are over the age of 50 lose \$324,044 in income and benefits over their lifetime when they completely exit the workforce for caregiving reasons.

State policies can support family caregivers in a number of ways. They can support them directly through providing supports for respite care, assessments, training, and through legislating access to paid leave at work, and

indirectly by properly funding and enforcing quality standards for nursing care and long-term service support workers (see Reinhard et al. 2014 for a state-by-state assessment of long-term care services and supports for older adults, people with disabilities, and family caregivers). Indicators of state-by-state family caregiver needs, and of work family supports specifically designed to support family caregivers, are still evolving.¹¹ The elder and dependent care component of the Work & Family Composite Index scores states on three items linked to financial supports for caregivers: unemployment insurance benefits for workers who have to leave their jobs because of family care; tax credits for dependent care that are not limited to child care, are refundable, and are \$500 or higher; and nurse delegation of long-term support service (LTSS) tasks to domestic care agency workers (nurse delegation of LTSS can lower the costs of hiring external help to provide care). In the context of the low earnings of many women, the high costs of hiring external help to care for a loved one may force a person to choose between her employment and providing the care herself.¹²

Figure 3.3.
Women’s Share of Part-Time Workers by Main Reason for Part-Time Work, 2013

Notes: Part-time workers are those who usually work between 1 and 34 hours per week.
Source: IWPR calculations based on U.S. Bureau of Labor Statistics 2013b.

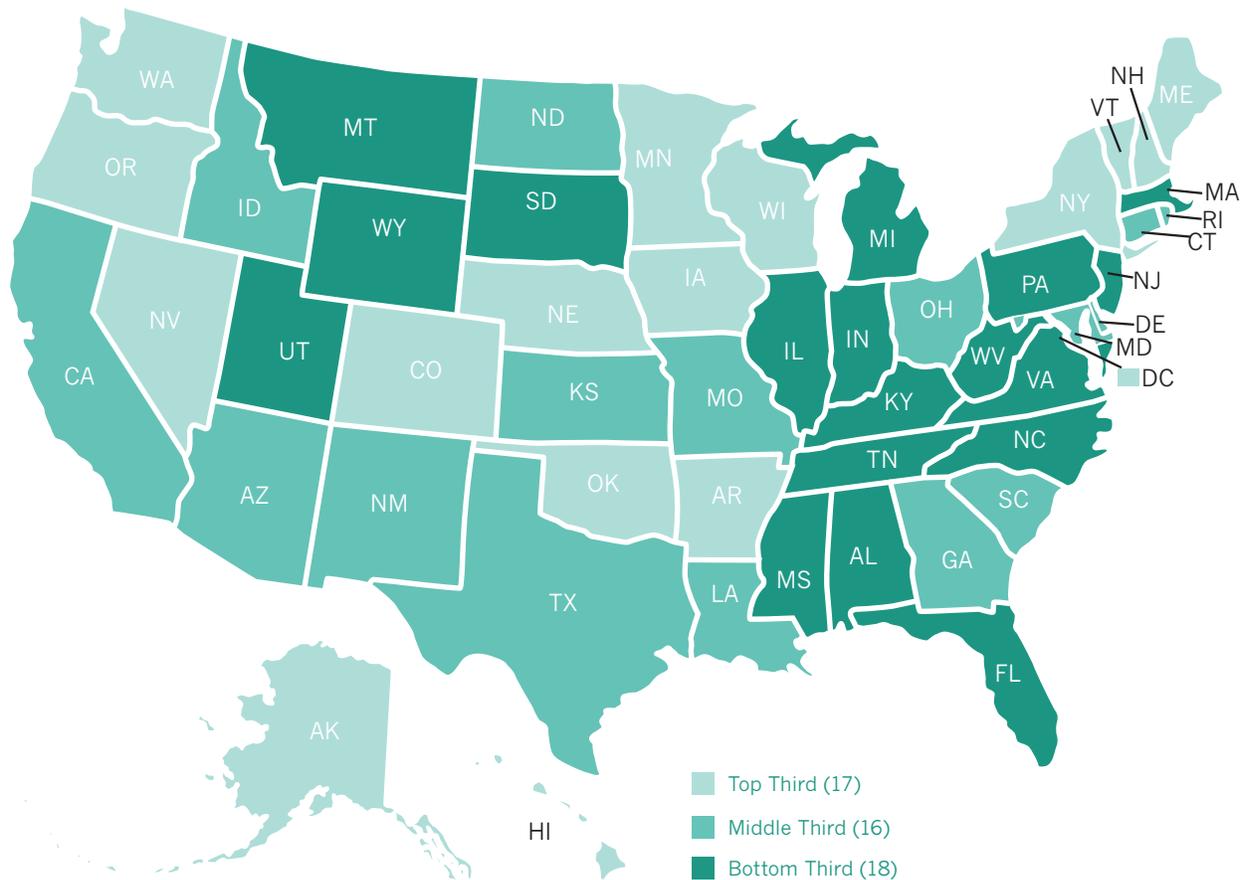

¹¹ To our knowledge, for example, there are no available state-by-state data to allow a comparison of respite care policies for caregivers.

¹² In states without nurse delegation, long-term support services (such as providing an insulin injection to someone with diabetes) have to be provided by a registered nurse when an agency is used to provide such services, increasing the costs of buying such care. The same restrictions do not apply when a family directly hires a caregiver.

- Twenty-four states and the District of Columbia recognize family care reasons as a legitimate cause of job loss for receiving unemployment insurance benefits (Appendix Table B3.2).
- In 21 states and the District of Columbia, dependent care tax credits can be claimed for the care for an adult family member; in ten of these states the tax credit is refundable, and in 13 it is higher than \$500 (Appendix Table B3.2).
- Of a total of 16 medical tasks, 17 states allow nurse delegation to an agency domestic care worker of 14 or more tasks; 5 states do not allow any nurse delegation (Appendix Table B3.2).
- The two best ranked states—Colorado and Minnesota—each make unemployment insurance available to someone who had to leave work to provide care for a family member, provide a refundable tax credit for dependent care of at least \$500, and allow full delegation of LTSS to domestic care agency workers (Appendix Table B3.2).
- The three worst ranked states—Florida, Indiana, and Michigan—do not extend unemployment insurance to workers who have to leave employment to provide family care, do not have a tax credit for dependent care, and do not allow nurse delegation of LTSS to domestic care agency workers (Appendix Table B3.2).

Map 3.3 indicates whether each state is ranked in the top, middle, or bottom third of the country on the elder and dependant care index.

Map 3.3. Elder and Dependent Care Index

Note: For methodology and sources, see Appendix A3. Calculated by the Institute for Women's Policy Research.

State and Local Laws to Support Caregivers at Work

Caregiver discrimination: A number of states have passed laws to protect family caregivers from discrimination at work (such as being fired for needing leave or denying leave for caregiving reasons or not being hired or promoted because one has caregiving responsibilities; Redfoot, Feinberg, and Smith Fitzpatrick 2014; Williams et al. 2012). The U.S. Equal Employment Opportunity Commission (EEOC) has clarified that both under Title VII of the Civil Rights Act and under the Americans with Disabilities Act it constitutes discrimination for an employer to treat a person adversely because he or she is a family caregiver or “associated with a person with a disability” (U.S. EEOC 2007). A number of states have issued laws to extend protections for family caregivers beyond what is covered in federal laws; most statutory protections in this field, however, have happened at the local level in cities and districts (Williams et al. 2012).

- Alaska, Connecticut, New Jersey, Oregon, and the District of Columbia prohibit discrimination against employees who have family responsibilities (Williams et al. 2012). Family caregiver discrimination protection in Alaska, New Jersey, and Oregon is limited to workers with child care responsibilities (Redfoot, Feinberg, and Smith Fitzpatrick 2014).
- At least 67 localities in 22 states have passed family caregiver protection ordinances; only 30 of these are not limited to workers with child care responsibilities and include care for parents or ill or disabled spouses (Williams et al. 2012).

Rights to Request Flexible Work: Workers in Vermont and San Francisco, since 2014, have a formal “right to request” flexible work arrangements. The Vermont law defined these as “intermediate or long-term changes in the employee’s regular working arrangements, including changes in the number of days or hours worked, changes in the time the employee arrives at or departs from work, work from home, or job sharing” (Vermont Commission on Women 2014). Under the law the employer must consider an employee’s request in good faith and may not retaliate against an employee for making a request. The law does not provide a right to changed working conditions, and there are a number of legitimate reasons for an employer to reject a request. While the impact of the Vermont law has not yet been evaluated, similar laws elsewhere in the world have contributed to making alternative work arrangements more widely accessible to workers (Hegewisch 2009).

Six in ten employed family caregivers made adjustments to their work arrangements in response to their caregiving responsibilities (National Alliance for Caregivers and AARP 2015). The proportion of employers in the 2014 *National Study of Employers* reporting that they provide elder care supports and allow job-protected leave for employees with elder care needs has increased since 2008 (Matos and Galinsky 2015). Yet the same study also finds that a falling share of employers allow more systematic (rather than one-off) adjustments to work arrangements. The share of employers who allow at least some employees to job share fell from 29 percent in 2008 to 18 percent in 2014, to take a sabbatical from 38 to 28 percent, and to have a break for personal or family responsibilities from 64 to 52 percent. Of those who left their jobs because of elder care responsibilities, more than half (52 percent) said they did so because their employers did not allow them the flexibility needed to combine work and elder care (Matos 2014). While both men and women find it difficult to combine employment with elder care, women are significantly more likely than men to report work-related difficulties (Matos 2014).

Predictable work schedules: In January 2015 the *Retail Workers Bill of Rights* became law in San Francisco. The law applies to large retailers and provides workers with a right to two weeks’ notice of their schedules; penalty pay if schedules are changed with less than one week’s notice; equal treatment for part-time and full-time workers; and minimum pay for workers who are on-call (whether they are called or not; Jobs with Justice 2015). San Francisco to date is the only locality to have passed such a statute; eight states and the District of Columbia have statutes that entitle an employee to receive some pay if he or she was scheduled to work but then is not needed (Golden 2015).

Whether caring for a child or a person with a disability, providing such care requires predictability and punctuality. Schedule irregularity, and corresponding variability in earnings, has increased strongly since 2000 and is reported by a significant number of workers irrespective of whether they formally work full-time, part-time, or are self-employed (Golden 2015). Schedule flexibility is a particular problem for low wage workers in retail and restaurants (Lambert, Fugiel, and Henly 2014; Watson and Swanberg 2011). According to one recent study, over four in ten mothers working in restaurants reported that their shifts changed weekly (39 percent) if not daily (5 percent); almost a third of mothers had incurred fines from their child care provider or had to change their child care arrangement altogether because of scheduling changes (Restaurant Opportunity Center 2013).

Mothers as Breadwinners

The large majority of mothers are in the workforce, including 62 percent of mothers who gave birth within the last 12 months (U.S. Department of Labor Women’s Bureau 2015). One in three workers (32 percent) have children under 18, and of these, a quarter have children younger than 6 years old (U.S. Bureau of Labor Statistics 2014). Of the 33.4 million households with children under 18, 22.3 million are headed by married couples, 8.4 million by single mothers, and 2.7 million by single fathers (Figure 3.4). Married fathers also spend more time on child care than previously (Pew Research Center 2015). Both mothers and fathers need accommodations at work, such as schedule flexibility.

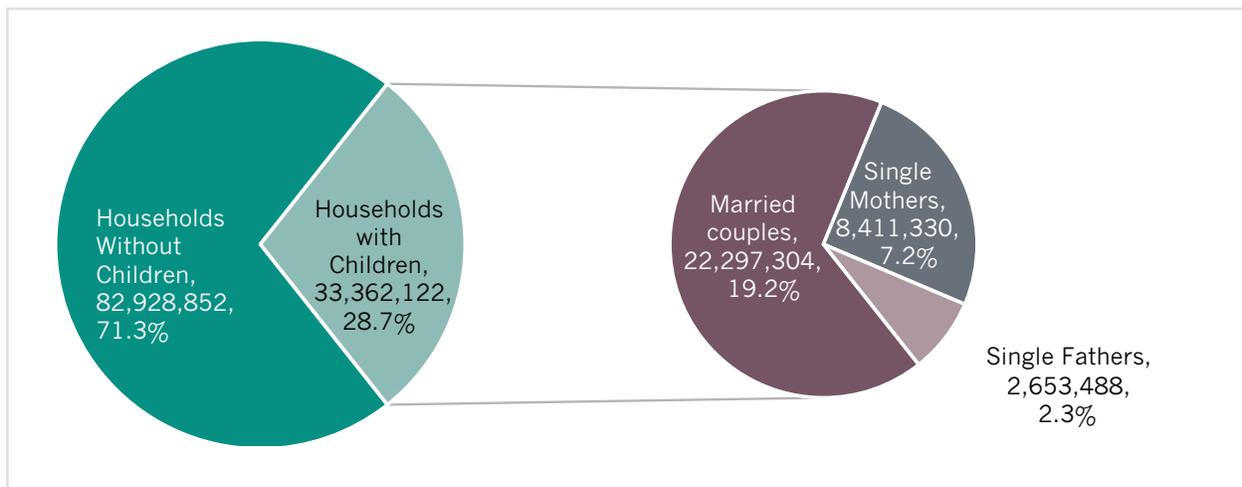

Mothers’ earnings make a major contribution to their family’s income. In half of all families, they are the sole provider or, in married couples, contribute at least 40 percent of family earnings (Table 3.3). Single mothers are a slight majority of female breadwinners (51 percent of mothers who make at least 40 percent of household

income). In married families with children, over a third of wives (37 percent) earn at least 40 percent of the couple’s joint earnings (Table 3.3). The share of female breadwinners¹³ varies considerably between states:

- Among all families with children, the District of Columbia has the highest share (64 percent) of breadwinner mothers. Mississippi (59 percent) and Rhode Island (56 percent) also have high shares of households with female breadwinners. The states with the lowest share of female breadwinners are Utah (35 percent), Wyoming, and Idaho (42 percent each).
- Among married couples with children, Vermont and the District of Columbia (46 percent each), and Iowa, Maine, and South Dakota (44 percent each) have the highest share of breadwinner mothers. The share of married breadwinner mothers among married couples with children is lowest in Utah (25 percent), Wyoming (31 percent), Idaho (32 percent), and Washington (33 percent).

Figure 3.4.

The Distribution of Households with Children Under 18 by Type, 2013

Notes: Data are three-year (2011–2013) averages. Single mothers and single fathers include those who are never married, married with an absent spouse, widowed, divorced, and separated. State-level data are available in Demographic Table B8.5.

Source: IWPR analysis of the American Community Survey microdata (Integrated Public Use Microdata Series, Version 5.0)

¹³ This definition of breadwinners (all single mothers and married mothers who contribute at least 40 percent of a couple’s joint earnings) is used for the remainder of this report; the wage gap means that a woman earns only 78 percent of a man’s earnings for full-time year round work; thus, when both work full-time, using median earnings, a woman’s earnings will only be approximately 40 percent of the joint earnings. A subset of women are the primary breadwinners in their families (the sole provider or earning more than half of a couple’s joint earnings, a definition used by Wang, Parker, and Taylor, 2013) in four of ten families with children under 18 (IWPR 2015).

Table 3.3.
Breadwinner Mothers in Households with Children Under 18, 2013

State	Households With Children Under 18		Households with a Breadwinner Mother as Percent of All Households with Children	Single Mothers as Percent of All Female Breadwinners	Married Couples With Female Breadwinner as Percent of All Married Couples
	Number	Percent	Percent	Percent	Percent

Wyoming	62,054	27.7%	42.1%	49.1%	30.7%
United States	33,280,267	28.6%	49.8%	50.7%	37.4%

Notes: Data are three-year (2011–2013) averages. Data on households with children under 18 are as percent of all households in the state. **A breadwinner mother is defined as a single mother who is the main householder (irrespective of earnings) or a married mother who earns at least 40 percent of the couple's joint earnings; single mothers who live in someone else's household (such as with their parents) are not included.

Source: IWPR analysis of American Community Survey microdata (Integrated Public Use Microdata Series, Version 5.0).

- The share of single mothers among female breadwinners is highest in the District of Columbia (66 percent), Louisiana (63 percent), and Mississippi (61 percent).
- The share of married mothers among all breadwinner mothers is highest in Hawaii (61 percent); in 12 other states, married mothers are at least 55 percent of female breadwinners (Table 3.3).

Having children can present a formidable range of obstacles at work, starting from inadequate protections during and after pregnancy, the high cost of child care, particularly for young children, to a school day and school year unaligned with the working day. Added to such challenges are biases against mothers at work (Correll, Benard, and Paik 2007; Williams and Segal 2003). Research suggests that mothers' earning power is curtailed by discrimination against them as mothers in addition to general factors that contribute to the gender wage gap (Budig 2014). Research finds no evidence that lower earnings are a reflection of lower productivity or of other factors that may justify lower earnings (Kmec 2011). The motherhood penalty is particularly marked for white mothers (Glauber 2007); the lack of a motherhood penalty for women of color is likely an expression of higher general levels of discrimination faced by all black and Hispanic women and men.

Child Care

Reliable child care support is essential for parents' employment. Quality early care and education also promote children's school readiness and have positive effects that last into adulthood (Yoshikawa et al. 2013) and are important for developing economically vibrant communities (Warner 2009). State policies on child care and early care and education differ on many aspects, including access and affordability of provisions, the number of hours provided by public programs, the training and supports available to/required of providers and teachers, after school and school vacation care, subsidies for low-income parents, and guidance provided to parents choosing providers (see for example Barnett et al. 2013; Child Care Aware of America 2013 and 2014a; Minton and Durham 2013; QRIS Compendium 2015; Schmit and Reeves 2015; Schulman and Blank 2013). The child care component of the Work & Family Composite Index focuses on just three indicators: the

costs of full-time center care for an infant as a proportion of the median annual earnings for women in the state, a measure chosen to illustrate the potential barriers created by the costs of care for families considering having children generally and particularly for mothers of young children who want to return to work; the share of four-year-olds who are in publicly funded Pre-K, Headstart, and special education; and policies in place to ensure quality of Pre-K care (each is discussed in greater detail below).¹⁴ States vary widely across these indicators (Map 3.4). Families in the Northeast and the South tend to have better access to quality, affordable care than families in the Mountain States and the West, but no state provides adequate child care supports to a majority of children under five.

The Cost of Early Care

The cost of child care can present a formidable burden to families with young children. Between 1985 and 2011, the weekly out-of-pocket expenditure on child care for families with an employed mother almost doubled in real terms (U.S. Census Bureau 2013). Only a small minority of young children (16 percent of infants and 25.5 percent of toddlers of employed mothers and fewer than five percent of toddlers and infants of mothers who are not employed) are in center care (Laughlin 2013). Families with children who have income below the poverty line spent 30 percent of their income on child care in 2011, more than three times the proportion families with above-poverty income spent (U.S. Census Bureau 2013; Smith and Adams 2013). The majority of all parents rely on care by relatives (including older siblings and grandparents), and more than one in four working mothers reports multiple child care arrangements (Laughlin 2013). Reliable and affordable child care is an important factor in enabling mothers in low-wage jobs to maintain employment and advance at work (Lee 2007).

As Child Care Aware of America (2014a) has documented, in the majority of states and the District of Columbia, the annual costs of center care for an infant are higher than the costs of attending a year of college at a public university, and in 22 states and the District of Columbia, the costs of center care for an infant exceed 40 percent of the median annual income of single mothers. The infant care cost indicator in the child care component of IWPR's Work & Family Composite

¹⁴ The choice of indicators is partly guided by data availability as well as by the desire to select only a few indicators to describe the terrain.

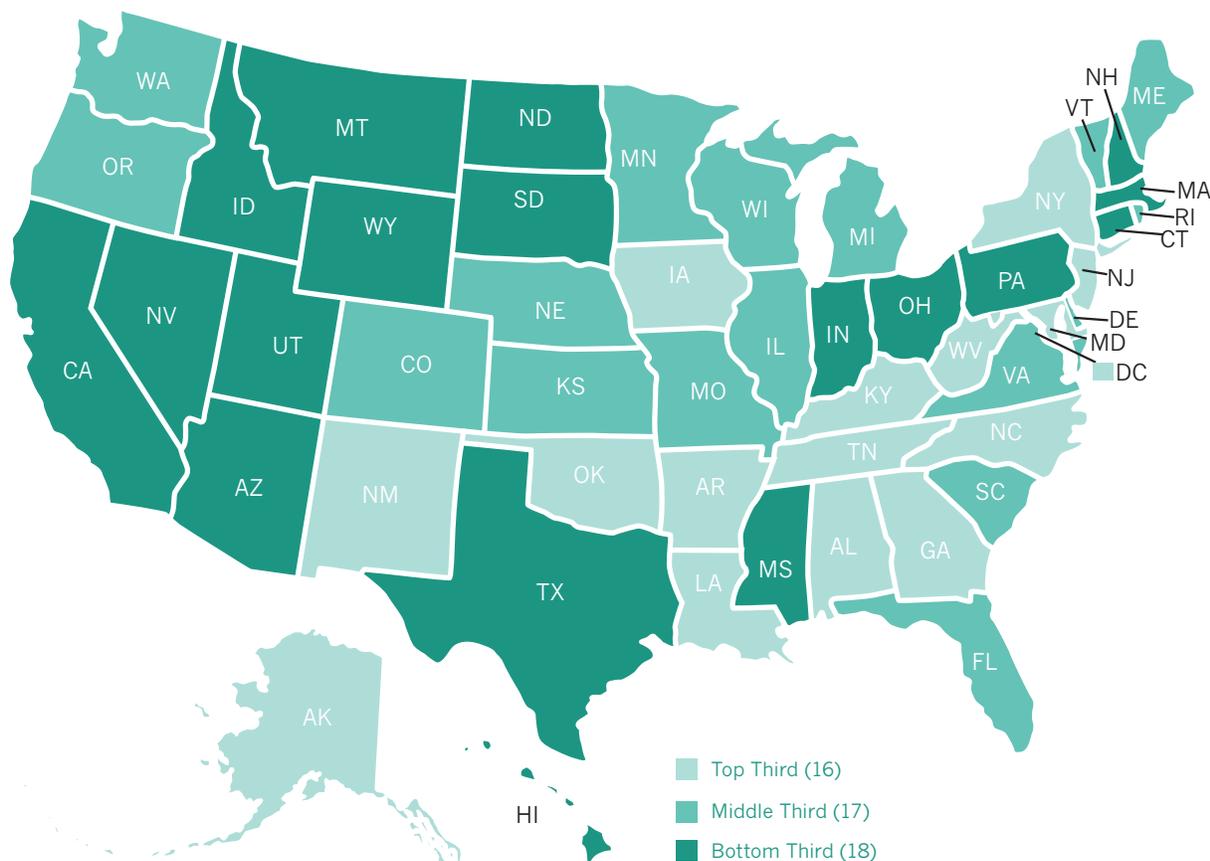

Index compares the cost of center-based infant care to the median annual earnings of all women, regardless of their parental status. The cost of full-time annual center care for infants varies considerably among states.

- The annual cost of center care for an infant as a proportion of women's full-time, year-round median annual earnings is lowest in Alabama (16.8 percent of women's median annual earnings). In seven other states—Arkansas, Kentucky, Louisiana, Mississippi, South Carolina, South Dakota, and Tennessee—the costs are also lower than 20 percent of women's median annual earnings.
- The cost is highest in the District of Columbia (36.6 percent); in two other states—Massachusetts and

Minnesota—costs are comparable to more than a third of annual earnings (Appendix Table B3.3).

This relative measure of the costs of child care does not capture the quality of center care. Indeed, lower relative costs of center care may simply reflect lower quality, such as high ratios of children to staff, larger group sizes, and lack of requirements for teacher certification. Lower cost may also indicate the absence of a market for higher-quality (higher-cost) infant care because of lower median earnings or, where costs are high, may be the sign of a market for high-quality, high-cost child care in response to higher numbers of well-paid women (such as in Washington, DC; Child Care Aware of America 2014a). By its nature, quality child care is labor intensive with limited scope for labor saving technologies or

Map 3.4. Child Care Index

Note: For methodology and sources, see Appendix A3. Calculated by the Institute for Women's Policy Research.

Pregnancy at Work

The number of women who work during their pregnancies has increased sharply during the past decades (Laughlin 2011). Pregnancy-related employment discrimination has increased, too. Between 1992 and 2007, charges of pregnancy discrimination filed with the U.S. Equal Employment Opportunity Commission increased by 65 percent (National Partnership for Women and Families 2008) and have increased further since then (U.S. EEOC 2015). The National Partnership study found a particularly sharp rise in claims from women of color; they also found that pregnancy claims had increased in the majority of states.

The Pregnancy Discrimination Act (PDA) of 1978 clarified that employment discrimination on the basis of pregnancy, childbirth, or related medical conditions is sex discrimination under Title VII of the Civil Rights Act of 1964. The law prohibits an employer from firing, or refusing to hire, a woman because of pregnancy as long as she is still able to perform the major functions of her job, prohibits an employer from treating an applicant or worker differently on the basis of pregnancy, mandates that an employer treat an employee temporarily unable to perform her job the same way as any other temporarily disabled employee, and requires that any health insurance provided by an employer cover expenses for pregnancy-related conditions, among other provisions (U.S. Department of Labor 2015c). Yet while the PDA protects women from pregnancy-related discrimination and from employers withholding benefits or accommodations to pregnant women that are received by other employees, it does not provide a general right to pregnancy accommodations (such as, for example, a temporary shift to lighter duties). Such rights are universal in other high-income countries (ILO 2014).

Since the Affordable Care Act was signed into law in 2010, new mothers returning to work have the right to reasonable time for pumping milk or breast feeding, in a private space, and to facilities for storing breast milk (U.S. Department of Labor 2015b).¹⁵ The new rule increased potential access to breastfeeding especially for low-wage mothers who are less likely to breastfeed than mothers with higher earnings (Drago, Hayes, and Yi 2010). Breastfeeding has positive effects on infant and child health (Golen and Ramey 2014; Horta and Victora 2013; Victora et al. 2015).

State Laws to Expand Pregnancy Protection

- Protections against pregnancy discrimination: Forty-five states and the District of Columbia offer protections against pregnancy discrimination. The five states that do not offer protections against pregnancy discrimination are Alabama, Indiana, Nevada, North Carolina, and South Dakota (U.S. Department of Labor 2015c).
- Pregnancy accommodation: In 14 states—Alaska, California, Connecticut, Delaware, Hawaii, Illinois, Louisiana, Maryland, Minnesota, Nebraska, New Jersey, North Dakota, Texas, and West Virginia—and the District of Columbia, as well as in five cities in other states, employers, by law, must provide reasonable accommodations for pregnant workers. Examples include transfers to a less strenuous or hazardous position, tasks that do not involve heavy lifting, breaks to go to the bathroom, and the option of sitting rather than standing (City of Pittsburgh 2014; National Partnership for Women & Families 2014c).
- Workplace breastfeeding rights: Nineteen states and the District of Columbia have passed laws providing workplace breastfeeding rights (such as break times and a private space for pumping breast milk): Arkansas, California, Colorado, Connecticut, Delaware, Hawaii, Illinois, Indiana, Louisiana, Maine, Minnesota, Montana, New Mexico, New York, Oregon, Rhode Island, Tennessee, Vermont, and Virginia (U.S. Department of Labor 2015c).

¹⁵ The U.S. Department of Labor advises that breastfeeding rights apply to all workers who are covered by the Fair Labor Standards Act (hourly paid and nonsupervisory workers) and should be made available to all workers. Small employers (with fewer than 50 workers) may be exempt from the rule if they can demonstrate that implementing it would impose undue hardship (U.S. Department of Labor Wages and Hours Division 2015b).

other cost saving innovations; without significant public funding, quality child care will remain out of reach for the majority of families (Blau 2001).

The regulation of center care is largely the responsibility of states rather than the federal government. The Child Care Development Block Grant (CCDBG) was reauthorized in 2014 (for the first time since 1996) with new health, safety, and licensing requirements for facilities receiving federal funds. Child care subsidies have a dual role, of raising the quality of programs, and of improving the access to quality programs for children in receipt of childcare subsidies. States are now required to inspect facilities that may receive CCDBG funds before they receive licensure, and at least annually once they are licensed, but have wide flexibility in setting other licensing and program parameters and vary widely in their licensing rules for child care centers (Child Care Aware of America 2013; 2014b).

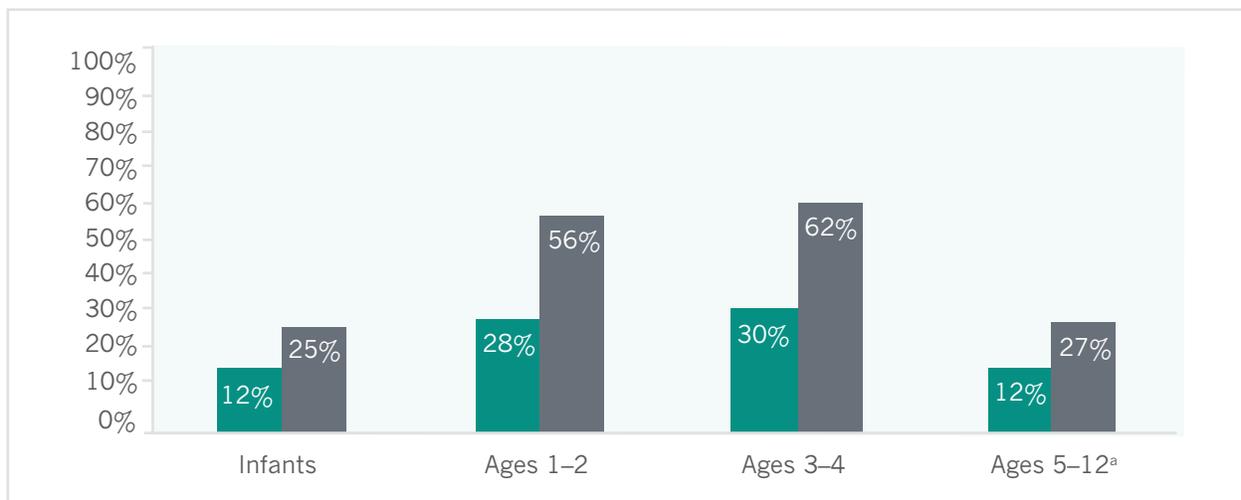

The CCDBG mandates that states spend a minimum of three percent on the improvement of the quality of infant and toddler care and include a four-percent set-aside (to rise to nine percent over a five-year period) for improvements to the quality of child care (U.S.

Department of Health and Human Services 2014a). The National Association for Regulatory Assistance (NARA) and the National Association of Child Care Resource and Referral Agencies (NACCRRA) have developed minimum standards and benchmarks for licensing of child care facilities (Child Care Aware of America 2013; Fiene and Martella 2012). The majority of states—38 in 2014, a steep increase since 2004 when there were just 9—have quality rating and improvement programs in place to monitor and improve the quality of early childhood education and care (QRIS Compendium 2015). Quality Rating and Improvement Systems (QRIS) are designed to improve quality beyond basic licensing standards and use a star rating system to make it easier for parents who need child care or early education to decide between different providers (Mitchell 2005). There is considerable variation, however, in the funding, design, and implementation of QRIS systems among states (Tout et al. 2010; QRIS Compendium 2015).

Child Care Subsidies

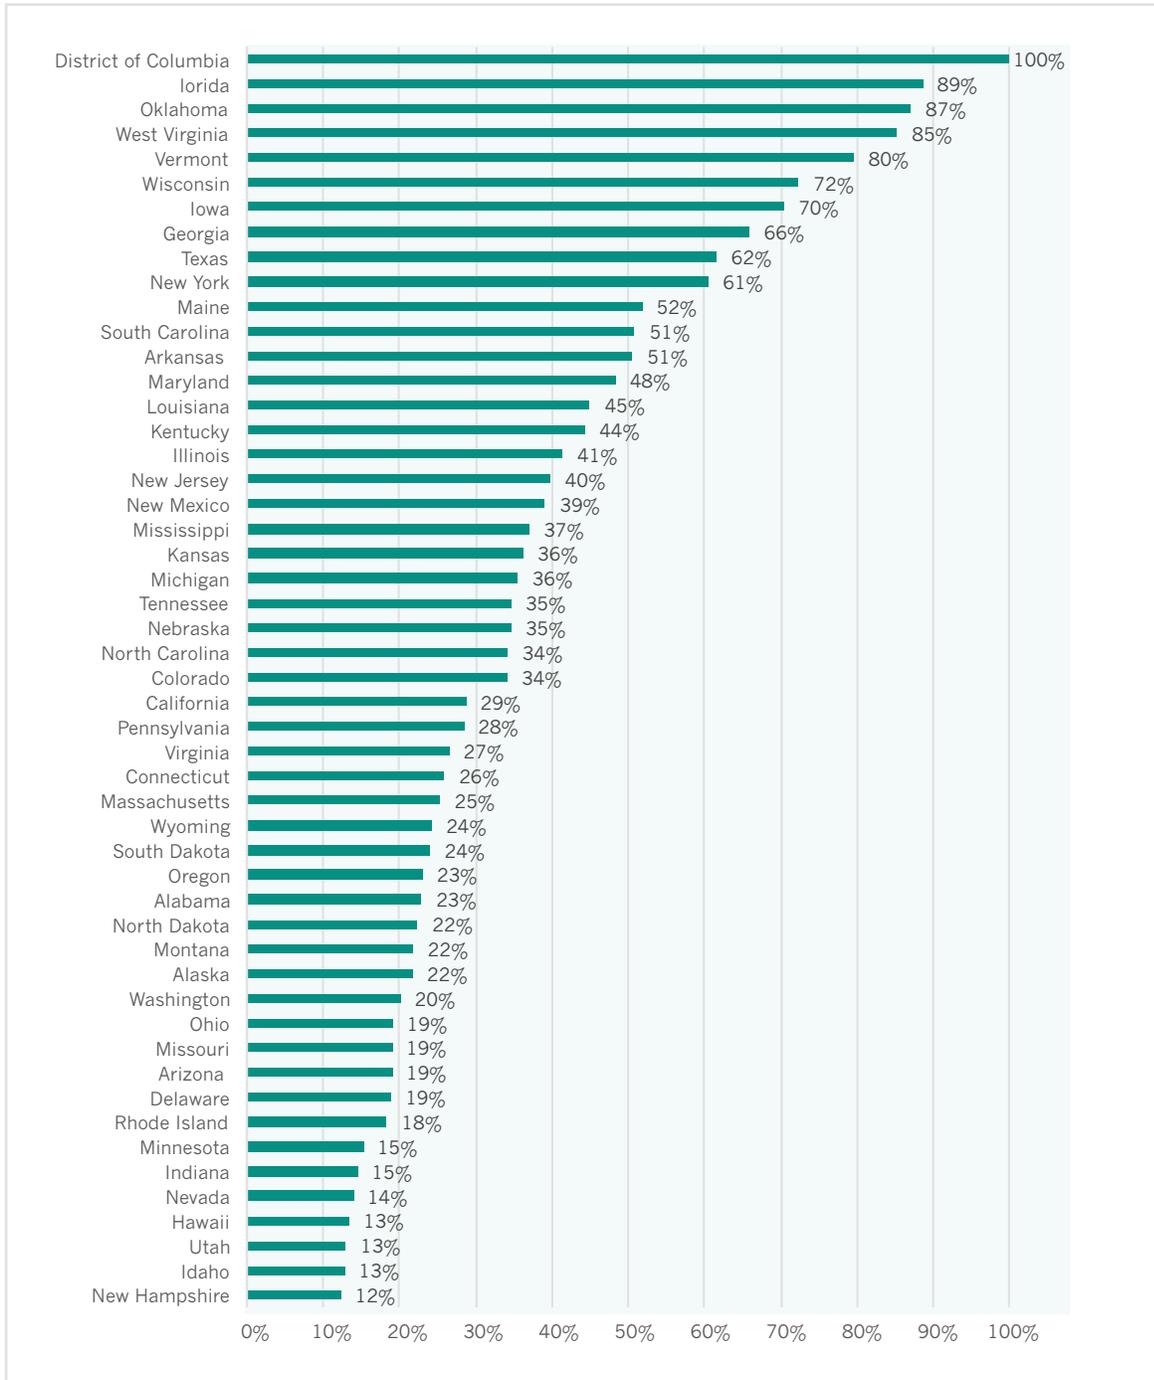

Child care subsidies help mothers and fathers access better quality child care, improve performance and advancement at work, and reduce child care-related work interruptions (Forry and Hofferth 2011; Tekin

Figure 3.5. Percent of Children Eligible under Federal Child Care Subsidy Parameters Who Received Child Care Subsidies, by Age and Poverty Status, 2011

Notes: Children living in households with incomes less than 85 percent of state median household incomes are eligible under federal parameters, subject to their parents' meeting work or training rules; states can set more restrictive eligibility rules. ^aIncludes eligible children with a disability under the age of 19. Figure 3.6.
Percent of Four-Year-Olds Enrolled in State Pre-K, Preschool Special Education, and State and Federal Head Start, 2013

Notes: Coverage rates do not differentiate between full-time and part-time preschool because of data availability. District of Columbia data may overstate coverage rates because of Census underestimates of the number of four-year-olds.
Source: Barnett et al. 2013.

2005; Wagner 2010). Nationally, in 2011, fewer than 4 percent of all infants and toddlers received any child care subsidies, and even among low-income families, only 11.8 percent of children under five received any financial supports for child care from government sources (Laughlin 2013). Federal funding for child care is provided to states through the Child Care Development Block Grant (CCDBG). States are permitted to use funds from the CCDBG to provide subsidies to eligible families with incomes below 85 percent of state median income, and states have considerable flexibility in how the subsidy system is designed and how families are treated when earnings rise above the income eligibility levels (Minton and Durham 2013). Whether parents receive child care assistance depends on a host of factors and policy decisions that differ from state to state, such as income eligibility limits, work requirements, waiting lists for child care assistance, copayments required of parents receiving child care assistance, reimbursement rates for child care providers serving families receiving child care assistance, and eligibility for child care assistance for parents searching for a job (Schulman and Blank 2013).

In 2011—the most recently published national data—only 17 percent of potentially eligible children under the federal CCDBG parameters received any child care subsidy (ASPE 2015).¹⁶ Figure 3.5 shows the proportion of eligible children who received subsidies for different age groups; even the lowest-income households (with incomes of less than 100 percent of poverty) were often left to their own devices, with only 25 percent of eligible infants, and 56–62 percent of eligible toddlers, having received any subsidies (Figure 3.5).

CCDBG rules require most families to pay part of the child care costs, but the share of families required to make a co-payment varies widely between states (from fewer than 15 percent of families in Arkansas and Nebraska to 90 percent or more of families in Connecticut, Illinois, New Hampshire, Ohio, and Utah; U.S. Department of Health and Human Services 2014a). The level of co-pay also varies widely, from an average of 3 percent of family income in the District of Columbia, Michigan, and Minnesota to 26 percent in Mississippi

(U.S. Department of Health and Human Services 2014b).¹⁷

The Coverage and Quality of Pre-Kindergarten Education

The benefits of preschool education for children's cognitive and social development are well established (see Yoshikawa et al. 2013 for a review of the evidence). Expansions of publicly funded early care and education also improve mothers' labor force participation and wage progression (Cascio 2006; Gelbach 2002) and have economic and job-creation benefits as a local economic development strategy (Warner 2009).

Nationally, in the 2012/2013 school year, 40.1 percent of four-year-olds were enrolled in publicly funded Pre-K, Head Start, or special education programs (27.9 percent were in Pre-K, and 12.2 percent were in Head Start¹⁸ or special education; Barnett et al. 2013). The national proportion of four-year-old children who are in publicly funded programs¹⁹ has increased substantially since 2001/2002, when it was only 31.2 percent (Barnett et al. 2003). The level of enrollment varies dramatically across the states. Figure 3.6 shows the state-by-state differences in the overall enrollment in public education for four-year-olds, irrespective of the numbers of hours provided per child.²⁰ Enrollment rates vary from only 12 percent in New Hampshire to 100 percent in the District of Columbia. In the District of Columbia, Pre-K is offered on the same schedule as school for older children (1068 contact hours per child during the school year); in Florida, the state with the next highest level of enrollment (89 percent of four-year-olds), Pre-K is available on a part-time basis only (540 contact hours during the school year; Barnett et al. 2013).

Only a few states provide both high Pre-K access and high-quality preschool education. The National Institute for Early Education Research (NIEER) assesses states on ten indicators of Pre-K quality, including measures such as class size, minimum qualification standards for teachers and teacher assistants, supports for vision- or hearing-impaired children, and site visits by educational

¹⁶ To be eligible under federal parameters, children must be under 13 years of age (under 19 if they have a disability) and must live in a household with income below 85 percent of the state's median household income, with parents who are employed or in training or education (depending on state policies); see ASPE (2015) for more detailed discussion of how eligibility is defined. States have the flexibility to use more restrictive eligibility criteria; in 2013 income eligibility rules in 14 states excluded any families with incomes above 150 percent of poverty (Schulman and Blank 2013).

¹⁷ State data available at www.statusofwomendata.org.

¹⁸ Head Start is a means tested program intended to provide comprehensive early education and support services to low-income 3- and 4-year-old children and their families; in 2013 only 42 percent of eligible children received services (Walker 2014).

¹⁹ Enrollment data for the remainder of this chapter are for four-year olds in all public programs, Pre-K, Head Start, and special education.

²⁰ States typically operate a variety of preschool programs with differing rules, making it difficult to assess the average hours offered to children in ECE in different states (Barnett et al. 2013; Holt 2014).

authorities to check on standards (Barnett et al. 2013). As Barnett et al. emphasize, however, these quality indicators measure program design features, not quality in the actual delivery of Pre-K education.

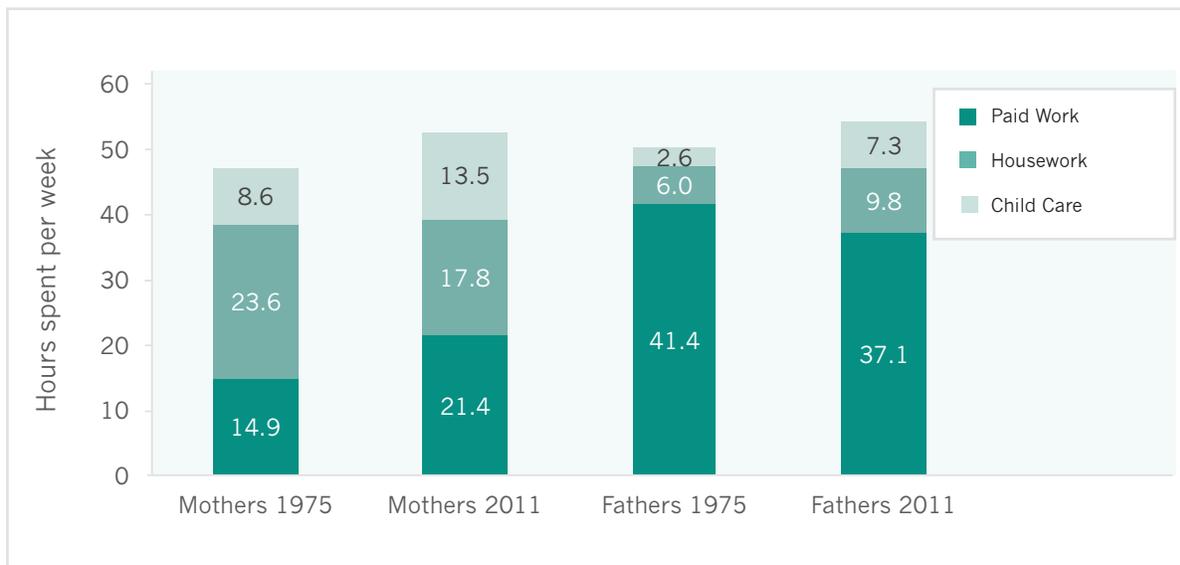

- In the District of Columbia, all four-year-olds have access to publicly provided preschool education.²¹ The District of Columbia also meets eight of ten Pre-K quality indicators. Other states with high rates of access and high quality ratings are Oklahoma (87 percent access and a quality rating of 9); West Virginia (85 percent access and a quality rating of 8); and Georgia (66 percent access and a quality rating of 8).
- There are four states—Alabama, Alaska, North Carolina, and Rhode Island—that meet all ten quality standards, but in all of these states, coverage rates are less than 35 percent.
- The states of Florida (89 percent) and Vermont (80 percent) are among the top ten states for access to Pre-K, but Florida meets only three and Vermont only four of ten quality standards.

- Access to public preschool education is lowest in New Hampshire (12 percent of four-year-olds). Other states with low access are Hawaii, Idaho, and Utah at 13 percent each. These states have also not implemented any of the quality indicators assessed by the National Institute for Early Education Research (Barnett et al. 2013).

The Gap in Mothers' and Fathers' Labor Force Participation Rates

During the past four decades, the labor force participation rate for mothers of children under six has more than doubled, from just under a third (32.1 percent) in 1970 to just over two thirds (67.1 percent) in 2013 (IWPR 2015). During the same period, the labor force participation rate of fathers hardly changed at all, falling from 97.9 percent in 1970 to 94.4 percent in 2013. Trends in the allocation of time between paid work, child care, and housework between 1975 and 2011 show that both mothers and fathers of young children now spend more time on these three activities combined than they did forty years ago (Figure 3.7). Yet, while mothers

Figure 3.7.
Time Spent on Paid Work, Housework, and Child Care, Mothers and Fathers, 1975 and 2011

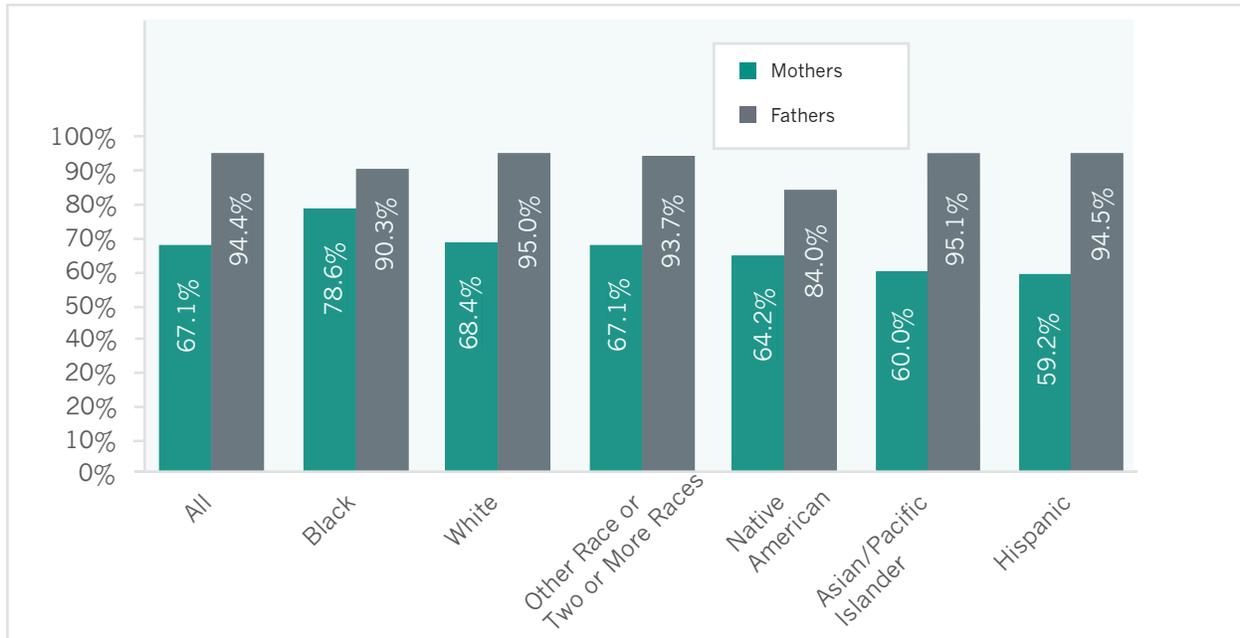

Note: Resident parents of children under 18.
Source: IWPR compilation of data from Pew Research Center 2015.

²¹ The share of enrolled children as a percent of all children draws on U.S. Census estimates of four-year-olds; in the District of Columbia, Census estimates may slightly underestimate the number of four-year-olds in the District, leading to a potential overestimate of the share of children in publicly funded preschool education (communication with Megan Carolan, NIEER, June 2014).

Figure 3.8.

The Labor Force Participation Rate of Parents of Children Under Six by Gender and Race/Ethnicity, United States, 2013

Notes: For individuals aged 16 and older. Racial categories are non-Hispanic. Hispanics may be of any race or two or more races. Source: IWPR analysis of the American Community Survey microdata (Integrated Public Use Microdata Series, Version 5.0)

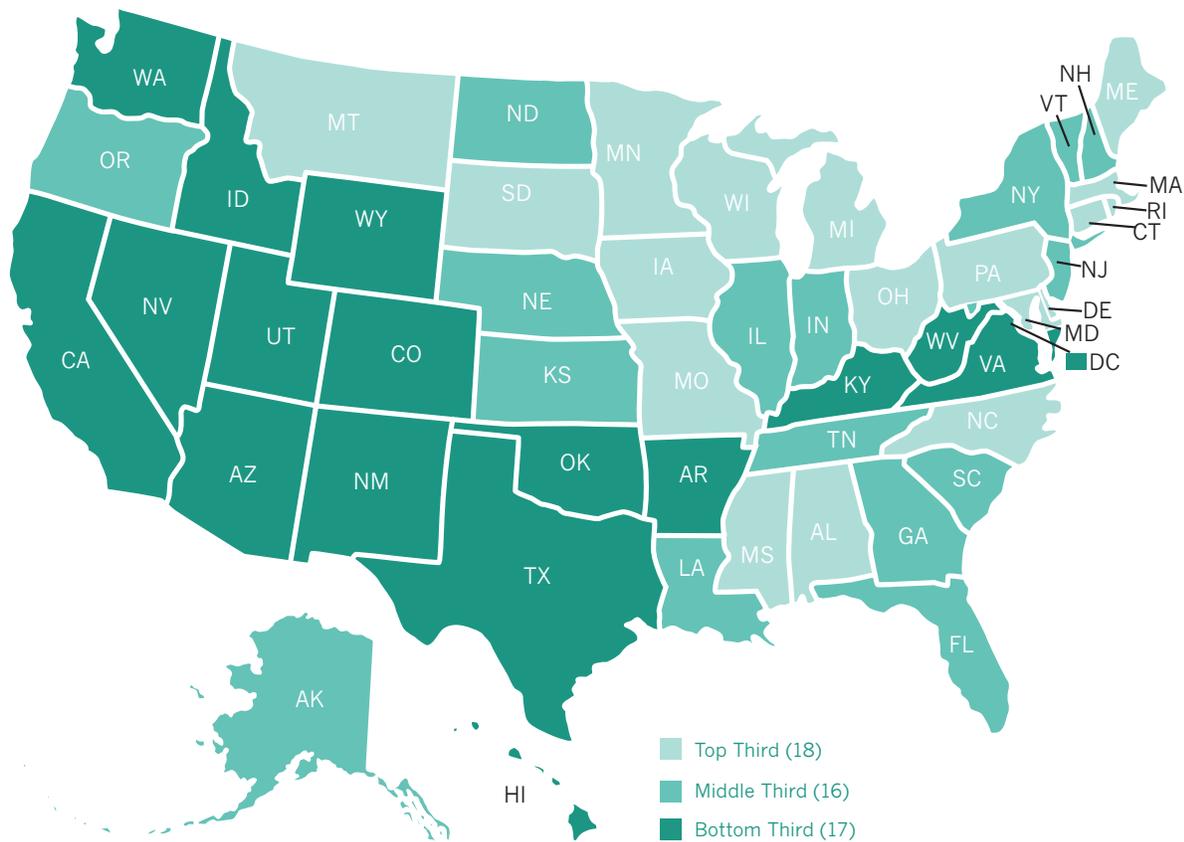

spend more time in paid work and fathers more time on housework and child care, overall mothers still do the large majority of family work and fathers still do the majority of paid work.

There are substantial differences in the likelihood that mothers of young children are in the workforce among women of the largest racial and ethnic groups. The labor force participation rates of black mothers of young children are substantially higher than among comparable mothers of any other racial/ethnic background. Seventy-nine percent of black mothers of children under the age of six are in the workforce, more than ten percentage points higher than the rate for all women (67.1 percent; Figure 3.8). Hispanic and Asian/Pacific Islander women have the lowest rates (at 59.2 and 60.0 percent respectively). Fathers are more likely to be in the workforce than mothers among all of the major racial and ethnic groups, and there is less variation among groups. Asian/Pacific Islanders and white men have the highest rates (95.1 and 95.0 percent respectively), and Native American fathers have the lowest rate (84 percent). The gap in parents' labor force participation rates is smallest for blacks and largest for Asian/Pacific Islanders and Hispanics (Figure 3.8).

Mothers of children under six are less likely than fathers to be in the labor force in all states, but the rates of mothers' labor force participation vary considerably across the states (Map 3.5). Only 53 percent of mothers in Utah are in the workforce, compared with 80 percent of mothers in South Dakota. There is a much smaller range for men's participation rates, ranging from 89 percent in Maine to 98 percent in Wyoming (Appendix Table B3.4).

- Utah has the largest gender gap in parental labor force participation (42.7 percentage points). Eight other states—Arizona, California, Hawaii, Idaho, Texas, Washington, West Virginia, and Wyoming—have gaps that are larger than 30 percentage points.
- Maine has the lowest gender gap (13.7 percent). Three other states—South Dakota (14.5 percentage points), Iowa (18.6 percentage points), and Wisconsin (19.6 percentage points)—have gaps that are smaller than 20 percentage points (Appendix Table B3.4).

Map 3.5. The Gender Gap in Parents' Labor Force Participation Rates

Notes: For women and men aged 16 and older with children under the age of six. Fathers' labor force participation rate minus mothers' labor force participation rate.

Conclusion

Given the high costs of quality child care, it is perhaps not surprising that many families reduce their time in the workforce when children are young, particularly when they have more than one child. In dual-earner families, women's lower earnings provide an economic rationale for the (lower-earning) mother rather than

the (higher-earning) father to be the one to leave paid work and focus on family care. Yet, having sustained time out of employment reduces women's earnings progression and over a lifetime, and this interruption can cost women dearly through lower earnings, fewer advancement opportunities, and reduced pension and retirement assets (Rose and Hartmann 2004).

Appendix A3:

Methodology

To analyze the status of women in the states, IWPR selected indicators that prior research and experience have shown illuminate issues that are integral to women's lives and that allow for comparisons between each state and the United States as a whole. The data in IWPR's *Status of Women in the States* reports come from federal government agencies and other sources; data in this report also rely on analysis from organizations such as AARP, Child Care Aware of America, the National Partnership for Women & Families, the National Institute for Early Education Research, and Tax Credits for Working Families.

Calculating the Composite Index

The four components of the Work & Family Composite Index—paid leave legislation, elder and dependent care, child care, and the gender gap in parents' labor force participation rates—were each weighted equally for a total value of the index of 8. With the exception of the gap in parental labor force participation, each component includes more than one indicator; the indicators were individually scored and weighted. The paid leave, unemployment insurance, dependent care credit for adults, dependent care credit refundability, and large size of dependent care credit indicators were scored on a simple yes/no basis. For the indicator based on the costs of center-based infant care as a proportion of women's median annual earnings, the state with the lowest proportional costs got the highest score and was the reference point for the other states' scores. The resulting values were summed for each state to create the four component scores and the composite index score. The states were ranked from the highest score (first place) to the lowest score (last place) of the composite index. Each state's score was compared with the ideal Composite Index score to determine the state's grade.

PAID LEAVE LEGISLATION: This component is based on three indicators—statewide Temporary Disability Insurance for all workers, statewide paid family care leave, and paid sick days (Gault et al. 2014; National Partnership for Women & Families 2014a and b). The indicators were weighted equally, with a score of 0.67 for a statewide law and a score of 0.33 for a local law (the maximum score in any leave area for a state without a statewide law, irrespective of the number

of localities with separate laws, is 0.33). As a practical matter, only paid sick days have been implemented at the local as well as the state level. The maximum score on this component is 2.0, which only California attained. Forty states had 0.0 scores.

ELDER AND DEPENDENT CARE: This component is based on three indicators: the availability of unemployment insurance benefits to someone who had to leave their job because of family care responsibilities based on a U.S. Department of Labor (2014) report and a study of states' unemployment insurance systems conducted by AARP (Ben-Ishai, McHugh, and Ujvari 2015); dependent care tax credits that can be applied to elder or adult dependent care expenses (Tax Credits for Working Families 2015); and nurse delegation of Long-term Support Services (LTSS; Reinhard et al. 2014). They are each weighted equally within this index, with a maximum score of 0.67 for each of the three indicators and a maximum total of 2.0 for this component.

Unemployment Insurance is scored on a yes/no basis: a state with a law, regulation, or policy interpretation allowing benefits receives a score of 0.67; other states receive a 0.

The dependent care tax credit indicator has three subcomponents: half of the value of the indicator is given to states where dependent care credits are available for the care of dependent adults, on a yes/no basis; 25 percent of the value of the indicator is given to states where the tax credit is refundable (yes/no basis); and another 25 percent to states where the value of the tax credit is at least \$500 (yes/no basis). The maximum value of the indicator is 0.67, the weight of this indicator in the elder and dependent care component of the Work & Family Composite Index.

Nurse delegation of LTSS: 16 tasks are considered for nurse delegation; the score is determined by dividing the number of tasks delegated in a state by the total number of possible tasks to be delegated (16), to a maximum value of 1.0. This score is then multiplied by 0.67, the weight of this indicator in the elder and dependent care component of the Work & Family Composite Index.

CHILD CARE: This component is based on three indicators: the costs of infant center care as a proportion of the median annual earnings of women; the percent of four-year-olds enrolled in state Pre-K, preschool special education, and state and federal Head Start programs; and the number of quality indicators met by the state's Pre-K programs. The costs of center-based infant care are based on the National Association of Child Care Resource and Referral Agencies' (NACCRRA) January 2014 survey of Child Care Resource and Referral State Networks, and in some states it is based on the most recently available state market rate survey (Child Care Aware of America 2014a). Median annual earnings for women who work full-time year-round were calculated based on American Community Survey data (IWPR 2015). The percent of four-year-olds enrolled in state Pre-K, preschool special education, and state and federal Head Start programs and the number of quality measures implemented by a state's Pre-K programs are based on the National Institute for Early Education Research (Barnett et al. 2013). The cost of infant care indicator has a maximum value of 0.5; the enrollment in state Pre-K, preschool special education, and state and federal Head Start programs and the quality of Pre-K indicators each have a maximum value of 0.75. The total value of this component is a maximum of 2.0.

The annual costs of infant care as a proportion of women's median annual earnings for full-time work: This indicator is scored by taking 1.0 minus the cost-to-earnings ratio of a state by the calculated value for the state with the best (lowest) cost-to-earnings ratio; the best state has a value of 1.0. The score is then multiplied by 0.5, the weight of this indicator in the child care component of the Work & Family Composite Index.

The proportion of four-year-olds in publicly funded Pre-K, preschool special education, and state and federal Head Start programs: The score of this indicator is the percent of four-year-old children in publicly funded programs divided by 100 percent; the maximum score of this indicator is 1.00 for 100 percent enrollment. The score is then multiplied with 0.75, the weight of this indicator in the child care component of the Work & Family Composite Index.

The quality of Pre-K education: The score of this indicator is based on NIEER's assessment of states on ten indicators of the quality of Pre-K provision; the score is 0 for states that do not have any programs or practices rated by the NIEER, 0.2 if one or two criteria are met, 0.4 for three or four criteria, 0.6 for five or six criteria, 0.8 for seven or eight criteria, and 1.0 for nine or ten criteria. The score is then multiplied with 0.75, the

weight of this indicator in the child care component of the Work & Family Composite Index.

GENDER GAP IN PARENTS' LABOR FORCE PARTICIPATION RATES: This indicator is calculated for women and men age 16 and older with children under the age of six. To score this indicator, mothers' participation rates (divided by 100 percent) are subtracted from fathers' participation rates (divided by 100 percent) in each state. To give the best-performing state the highest score, a state's differential is subtracted from 1. The score is then multiplied by 2. The total value of this component is a maximum of 2.0, if a state were to have equal labor force participation rates for mothers and fathers. The data on labor force participation rates of parents aged 16 and older with children under age six are based on microdata analysis of the American Community Survey 2013.

Counting Breadwinner Mothers

For the data on breadwinner mothers, IWPR analyzed American Community Survey microdata, combining three years of data (2011, 2012, and 2013) to ensure sufficient sample sizes. IWPR constructed a multi-year file by selecting the 2011, 2012, and 2013 datasets, adjusting dollar values to their 2013 equivalents using the Consumer Price Index for All Urban Consumers and averaging the sample weights to represent the average population during the three year period. Female breadwinners are defined as single mothers who are the main householder, irrespective of earnings or cohabitation, and as married mothers who earn at least 40 percent of the couple's earnings. Single mothers are defined as women who are never married, divorced, separated, or widowed, or where the husband is absent. All households with children under 18 who are related to the main householder by blood, adoption, or marriage are included in the denominator for the analysis of the share of households with female breadwinner mothers. IWPR used personal weights to obtain nationally representative statistics for person-level analyses. Weights included with the IPUMS ACS for person-level data adjust for the mixed geographic sampling rates, nonresponses, and individual sampling probabilities. Estimates from IPUMS ACS samples may not be consistent with summary table ACS estimates due to the additional sampling error and the fact that, over time, the Census Bureau changes the definitions and classifications for some variables. The IPUMS project provides harmonized data to maximize comparability over time; updates and corrections to the microdata released by the Census Bureau and IPUMS may result in minor variation in future analyses.

Table B3.4.
Gender Gap in Parents' Labor Force Participation Rates, 2013

	Mothers' Labor Force Participation Rate	Fathers' Labor Force Participation Rate	Difference in Labor Force Participation Rates	
State	Percent	Percent	Percentage Point Gap	Rank
Alabama	70.1%	91.0%	+20.9	7
Alaska	68.3%	94.8%	+26.5	32
Arizona	59.8%	91.7%	+31.9	46
Arkansas	62.9%	92.8%	+29.9	42
California	62.1%	94.4%	+32.3	47
Colorado	65.1%	94.0%	+28.9	38
Connecticut	72.2%	95.5%	+23.3	12
Delaware	70.8%	92.1%	+21.3	8
District of Columbia	67.5%	96.3%	+28.8	37
Florida	67.7%	94.0%	+26.3	30
Georgia	68.5%	94.2%	+25.7	24
Hawaii	65.9%	96.5%	+30.6	44
Idaho	58.4%	97.1%	+38.7	50
Illinois	69.8%	95.6%	+25.8	26
Indiana	67.6%	94.2%	+26.6	33
Iowa	77.0%	95.6%	+18.6	3
Kansas	69.9%	96.6%	+26.7	34
Kentucky	66.1%	93.9%	+27.8	36
Louisiana	68.6%	94.2%	+25.6	23
Maine	75.3%	89.0%	+13.7	1
Maryland	72.5%	95.6%	+23.1	11
Massachusetts	72.5%	96.0%	+23.5	13
Michigan	68.4%	92.4%	+24.0	17
Minnesota	74.8%	95.6%	+20.8	6
Mississippi	73.4%	93.6%	+20.2	5
Missouri	70.4%	94.1%	+23.7	15
Montana	69.8%	93.8%	+24.0	17
Nebraska	72.9%	97.1%	+24.2	19
Nevada	65.9%	95.0%	+29.1	39
New Hampshire	71.1%	95.4%	+24.3	20
New Jersey	69.3%	95.6%	+26.3	31
New Mexico	62.2%	91.9%	+29.7	41
New York	67.5%	93.2%	+25.7	25
North Carolina	70.8%	94.6%	+23.8	16
North Dakota	71.3%	97.2%	+25.9	27
Ohio	70.6%	93.6%	+23.0	10
Oklahoma	63.9%	93.5%	+29.6	40
Oregon	66.0%	92.0%	+26.0	28
Pennsylvania	70.5%	94.0%	+23.5	13
Rhode Island	71.7%	94.6%	+22.9	9
South Carolina	68.7%	93.9%	+25.2	21
South Dakota	80.3%	94.8%	+14.5	2
Tennessee	67.7%	93.8%	+26.1	29
Texas	61.9%	95.2%	+33.3	49
Utah	52.8%	95.5%	+42.7	51
Vermont	69.4%	94.8%	+25.4	22
Virginia	69.2%	96.3%	+27.1	35
Washington	63.0%	94.8%	+31.8	45
West Virginia	61.3%	91.5%	+30.2	43
Wisconsin	76.6%	96.2%	+19.6	4
Wyoming	65.3%	98.0%	+32.7	48
United States	67.1%	94.4%	+28.2	

Notes: Difference in labor force participation rates equals fathers' labor force participation rate minus mothers' labor force participation rate. For women and men with a child under six in the household related by birth, marriage, or adoption.
